

# Routing and Switching

## Course Information

Dr. Fawaz Saleem  
Bokhari

# Course Information

1. Network Fundamentals
2. Routing Protocols and Concepts
3. Switching Techniques

# Course Material

## Text Book/s

- Introduction to Networks by Cisco Press
- Routing and Switching Essentials, Companion Guide by Cisco Academy

## Tools

- Packet Tracer

<http://www.cabrillo.edu/~rgraziani/>

# Grading

Quiz: **15%**

Mid-Term: **35%**

Final-Term: **50%**

# Tips

## Succeeding in this course

- Find a quiet space
- Do not multitask
- Take notes on paper or in your book

# Components of a Network

**Technology  
Then and Now**

The background features a light blue grid pattern. On the right side, there are several curved, overlapping lines in various colors including purple, blue, green, and yellow, creating a sense of motion and depth.

# Technology Then and Now

**"Fixed" Computing**  
(You go to the device)

**Mobility/BYOD**  
(The device goes with you)

**Internet of Things**  
(Age of Devices)

**Internet of Everything**  
(People, Process, Data, Things)

# Networks Support the Way We Learn

- Virtual Classrooms
- On-demand Video
- Collaborative Learning Spaces
- Mobile Learning

# Networks Support the Way We Communicate

- Instant Messaging (IM)
- Social Media
- Weblogs
- Podcasting
- P2P File Sharing

# Networks Support the Way We Play/Do Business

- Online Gaming
- Online Shopping
- Online Entertainment

# Network Components - Clients and Servers

## Hosts

- Client, Server, or both
- Software determines the role
- Run application programs

## Servers

- Provide information and services to clients
- e-mail or web pages

## Clients

- Request information from the server.

# Peer to Peer

## Advantages

- Easy to set up
- Less complexity
- Lower cost

## Disadvantages

- No centralized administration
- Not so secure
- Not scalable

# Network Components

Devices  
Media

# End Devices

- Computers
- Printers
- VoIP Phones
- Security Cameras
- Mobile Handheld Devices

# Intermediary Network Devices

- Network Access (Switches and Wireless Access Points)
- Internetworking (Routers)
- Security (Firewalls)

# Network Media

## Network Media

Copper

Fiber Optics

Wireless

- Copper – Electronic pulses
- Fiber Optics – Pulses of light
- Wireless – Electromagnetic waves

# Network Representations

WAN Media

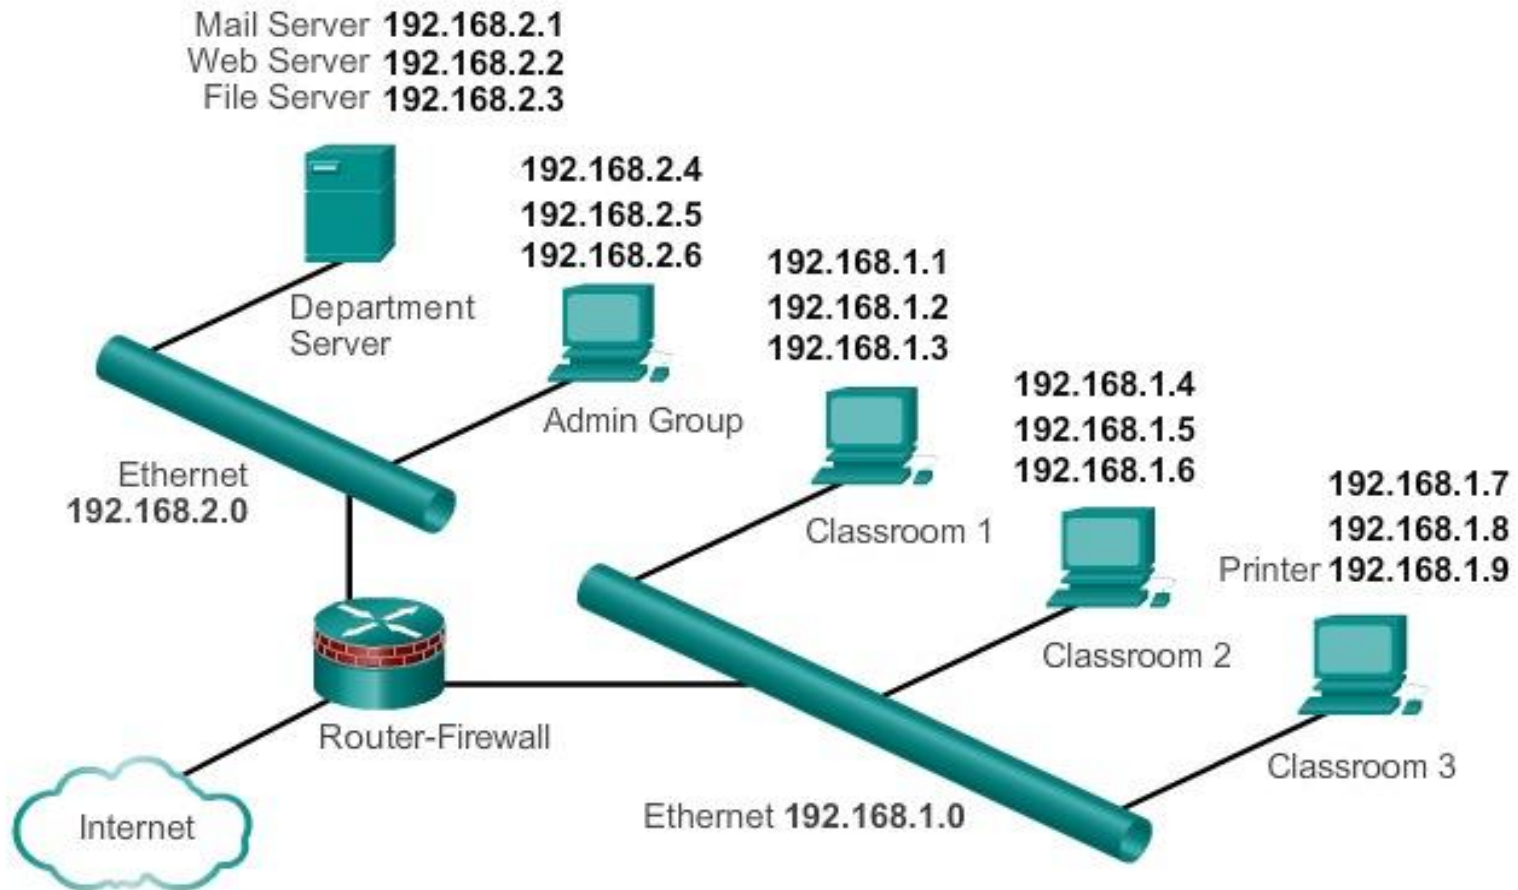

# Topology Diagrams

## Physical Topology

# Topology Diagrams

## Logical Topology

# Topology Diagrams

**Logical Topology**

**Physical Topology**

# LANs, WANs and the Internet

## Types of Networks

# Types of Networks

- Local Area Network (LAN)
- Wide Area Network (WAN)
- Metropolitan Area Network (MAN)
- Wireless LAN (WLAN)
- Storage Area Network (SAN)

# Local Area Network (LAN)

- Interconnects devices in a limited area
- Administered by single organization/individual
- Provide high speed bandwidth

# Wide Area Network (WAN)

- Interconnects LANs
- Administered by multiple service providers
- Slower speed links between LANs

# MAN, WLAN, and SAN

## MAN

- Greater than LAN but smaller than WAN

## WLAN

- Similar to LAN but wireless

## SAN

- Designed to support file servers, and provide data storage.

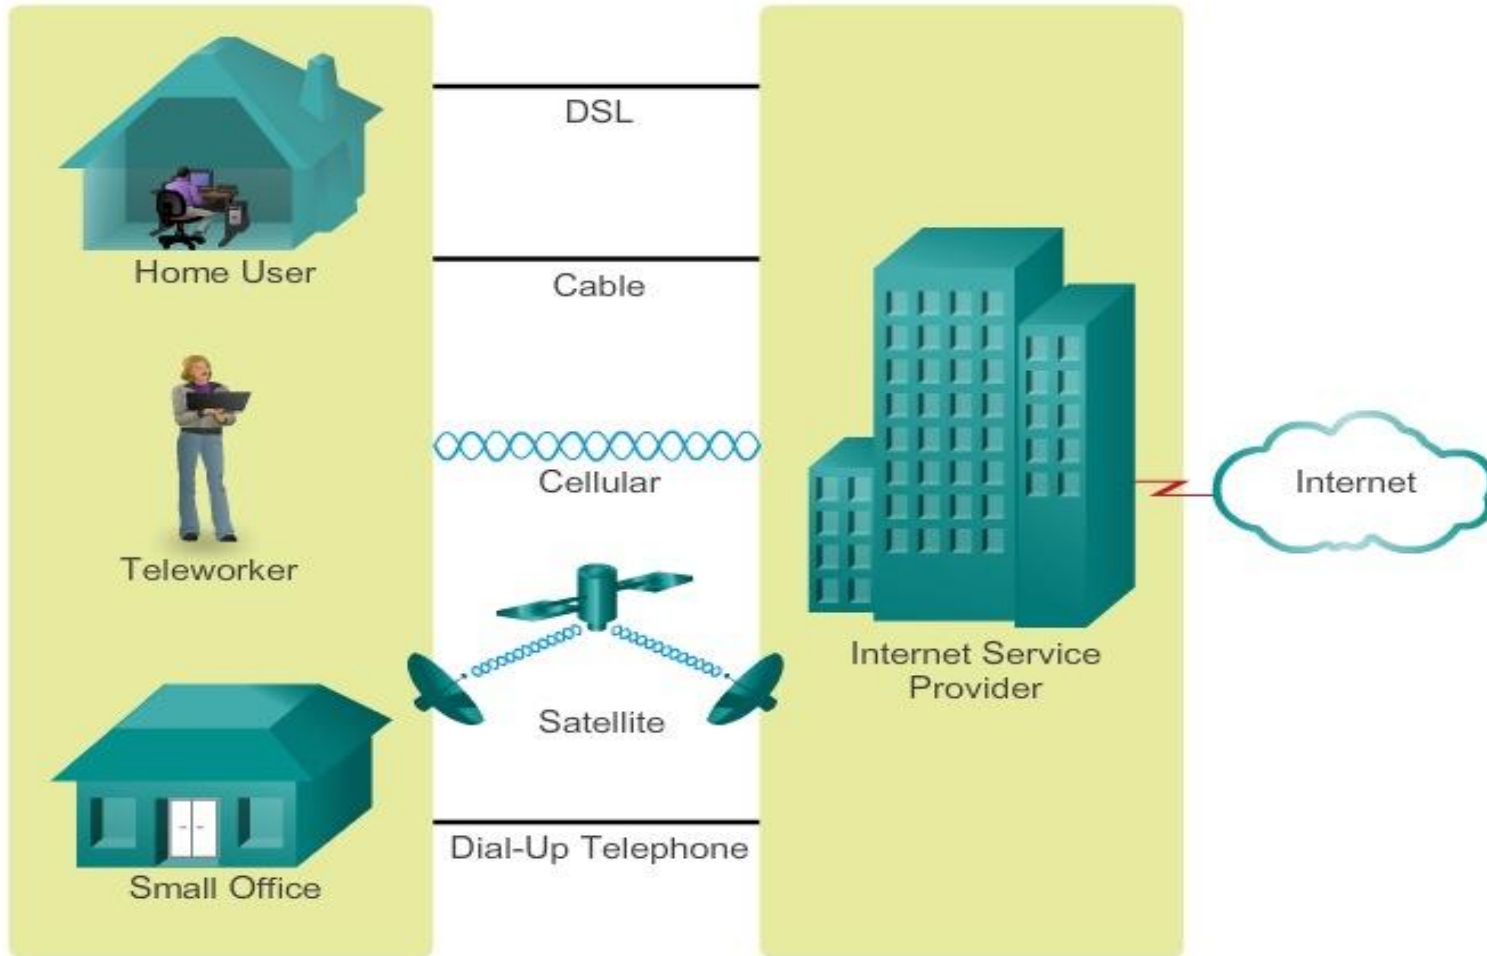

# The Internet – A Network of Networks

The background of the slide features a light blue grid pattern. Overlaid on this grid are several vibrant, multi-colored wavy lines that sweep across the lower right portion of the slide, creating a dynamic and modern aesthetic.

# Rules of Communication

Establishing  
Rules

# Establishing Rules

- Communication begins with a message, or information, that must be sent from a source to a destination

**Protocol:** Rules that govern communications

**Protocol suite:** A group of inter-related protocols

Example: TCP/IP

# Message Encoding

# Message Formatting and Encapsulation

Recipient (destination) Location address	Sender (source) Location address	Salutation (start of message indicator)	Recipient (destination) identifier	Content of Letter (encapsulated data)	Sender (source) identifier	End of Frame (End of message indicator)
Envelope Addressing		Encapsulated Letter				
1400 Main Street Canton, Ohio 44203	4085 SE Pine Street Ocala, Florida 34471	Dear	Jane	I just returned from my trip. I thought you might like to see my pictures.	John	

# Message Size, Timing, Access Method

## Message Size

- Breaks into smaller size or sentences

## Timing

- When to speak, and how long to wait for a response

## Access Method

- Determines when someone is able to send a message
- If two people talk at the same time, a collision occurs
- Hosts need an access method to know when to begin sending messages

# Flow Control, Response Timeout

## Flow Control

- How much information can be sent.
- Hosts use flow control to negotiate how much data can be sent/received

## Response Timeout

- Hosts on the network also have rules that specify how long to wait for responses and what action to take if a response timeout occurs

# Internetwork Operating System (IOS)

Cisco IOS

# Cisco IOS

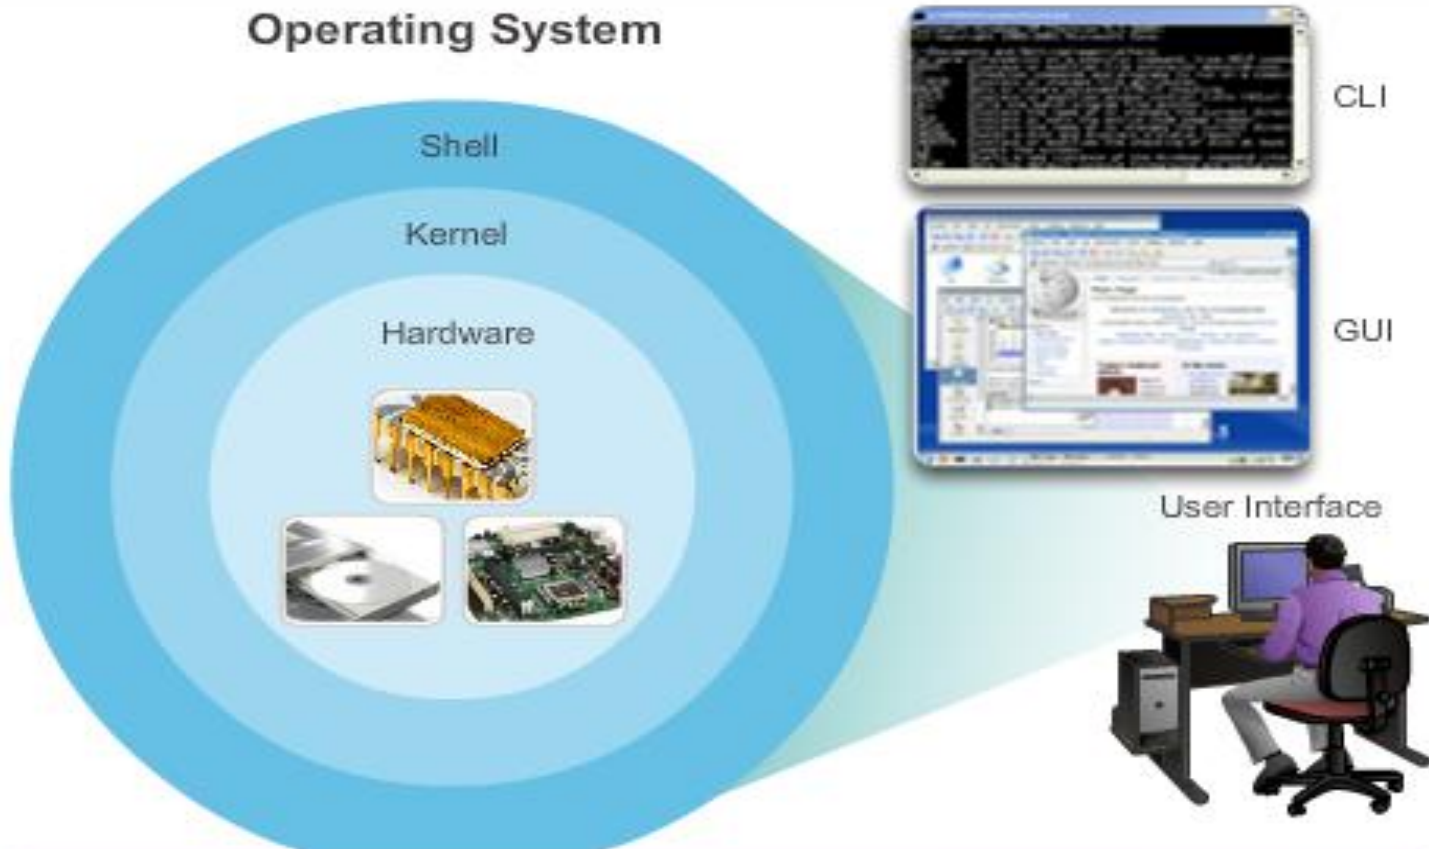

- All networking equipment depend on operating systems:

- End users
- Switches
- Routers
- Wireless access points
- Firewalls

## **Cisco Internetwork Operating System (IOS)**

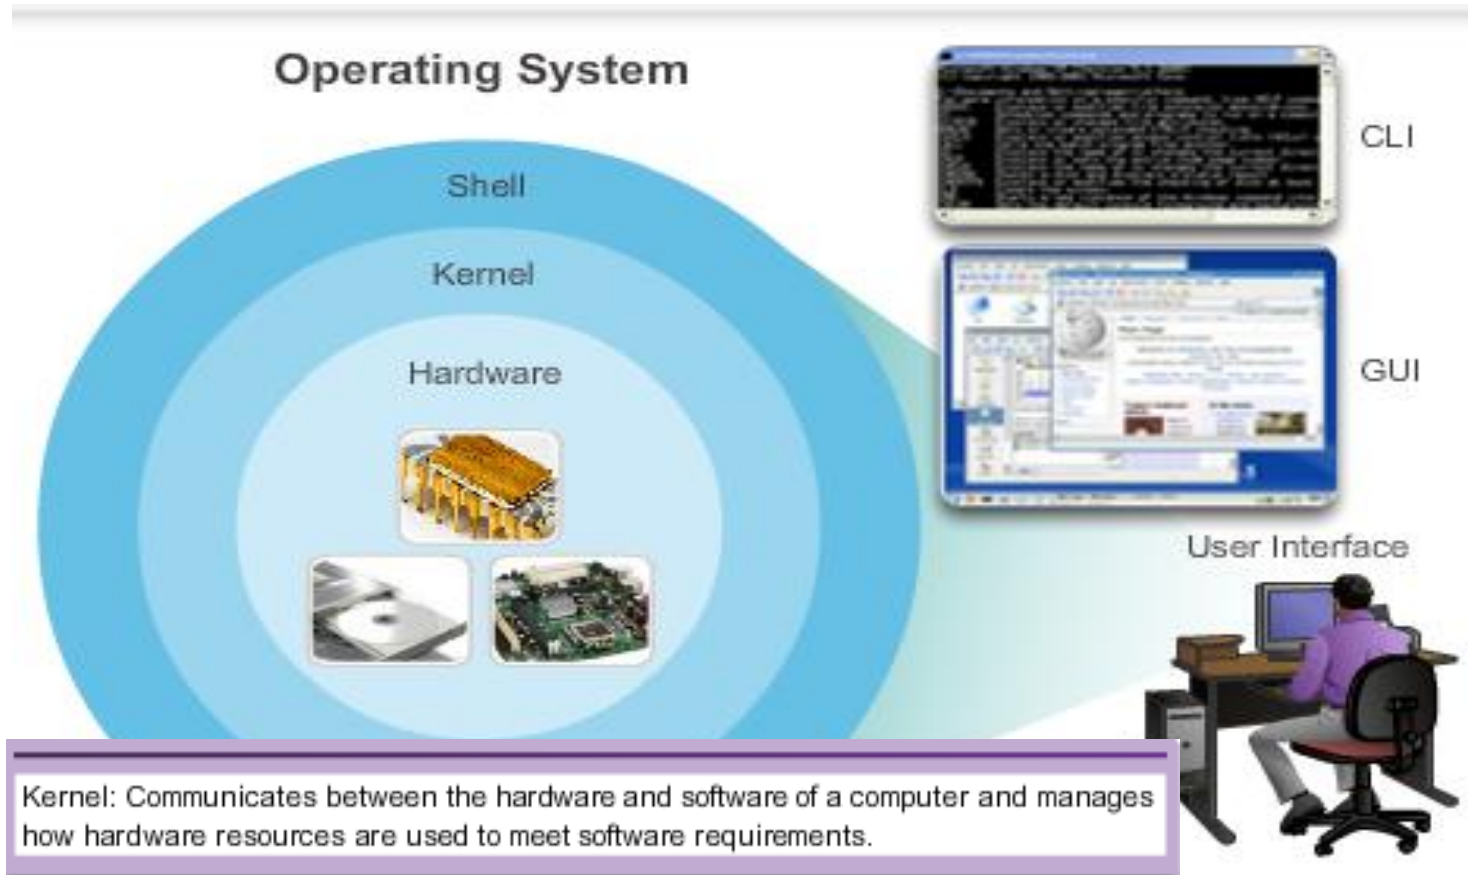

- Collection of network operating systems used on Cisco devices

# Operating System

Shell: The user interface that allows users to request specific tasks from the computer. These requests can be made either through the CLI or GUI interfaces.

# Operating System

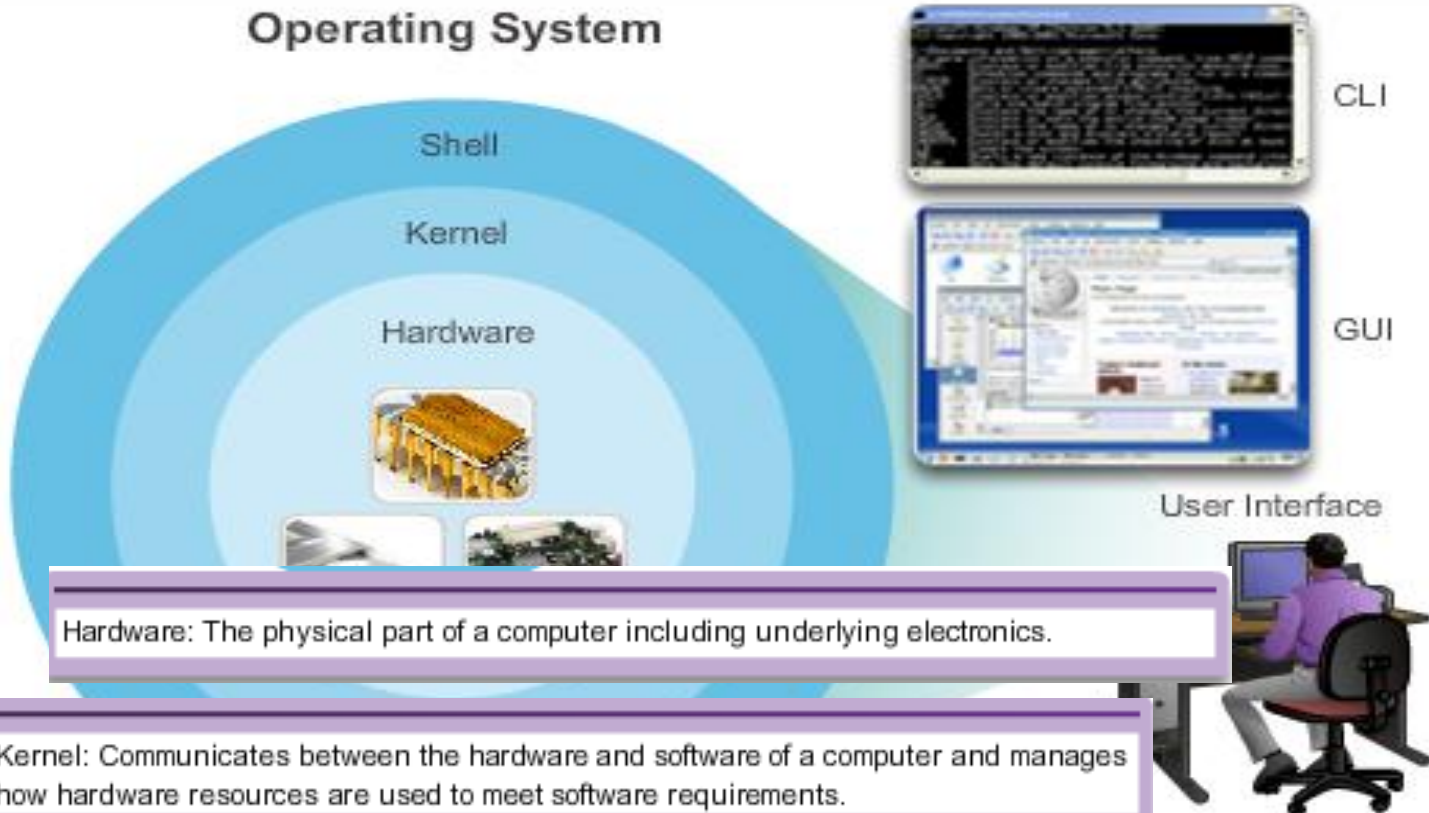

Kernel: Communicates between the hardware and software of a computer and manages how hardware resources are used to meet software requirements.

Shell: The user interface that allows users to request specific tasks from the computer. These requests can be made either through the CLI or GUI interfaces.

# Operating System

Hardware: The physical part of a computer including underlying electronics.

Kernel: Communicates between the hardware and software of a computer and manages how hardware resources are used to meet software requirements.

Shell: The user interface that allows users to request specific tasks from the computer. These requests can be made either through the CLI or GUI interfaces.

# IOS Functions

Security

Routing

QoS

Internetwork Operating System for Cisco networking devices

Addressing

Managing Resources

Interface

# Accessing an IOS Device

Console  
Access  
Methods

# Console Access Methods

- Most common methods to access the Command Line Interface
  - Console
  - Telnet or SSH
  - AUX port

# Console Port

- Device is accessible even if **no networking services** have been configured
- Need a special console cable (aka **rollover cable**)
- Allows configuration commands to be entered
- Should be configured with **passwords** to prevent unauthorized access
- Device should be **located in a secure room** so console port can not be easily accessed

# Telnet, SSH, and AUX Methods

## Telnet

- Method for **remotely accessing the CLI** over a network
- **Require active networking services** and one active interface that is configured

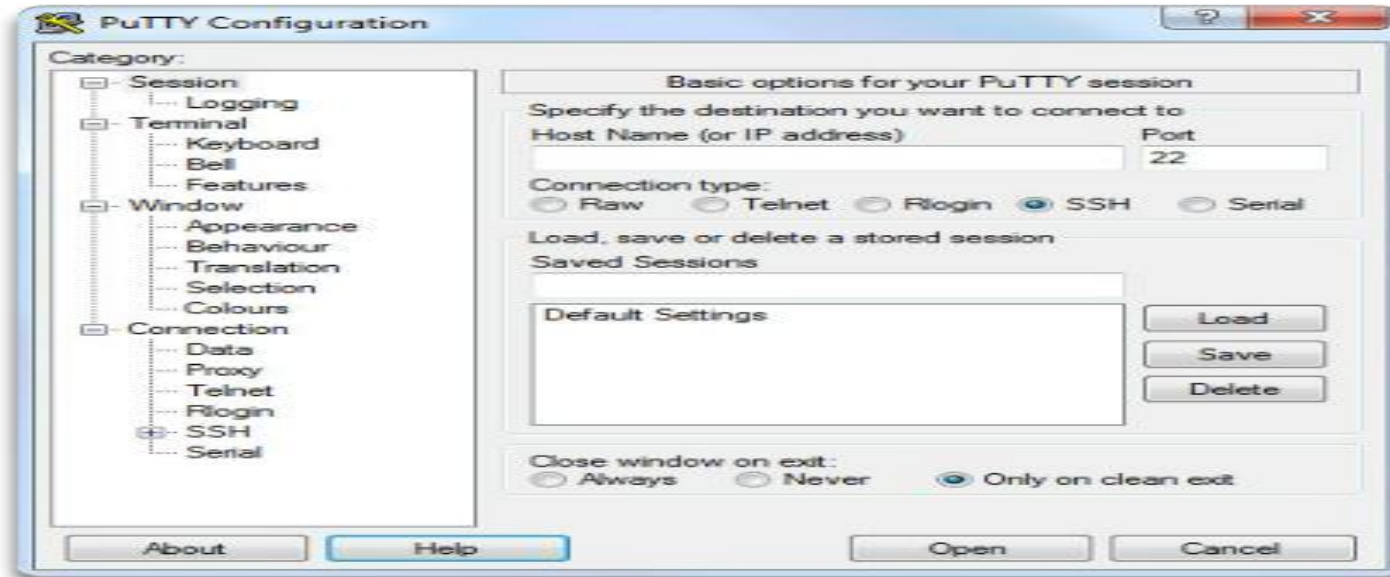

## Secure Shell (SSH) – Preferred over Telnet

- Remote login similar to Telnet but utilizes **more security**
- Stronger password authentication
- Uses encryption when transporting data

## Aux Port (not used too much)

- Out-of-band connection
- Uses telephone line
- Can be used like console port

# Terminal Emulation Program

Software available for connecting to a networking device (usually same as terminal/serial/console connection):

- PuTTY
- Tera Term
- HyperTerminal
- OS X Terminal

# Navigating the IOS

## IOS Modes of Operation

# IOS Modes of Operation

## IOS Mode Hierarchical Structure

### User EXEC Command-Router>

ping  
show (limited)  
enable  
etc.

### Privileged EXEC Commands-Router#

all User EXEC commands  
debug commands  
reload  
configure  
etc.

### Global Configuration Commands-Router (config) #

hostname  
enable secret  
ip route

interface ethernet  
serial  
dsl  
etc.

### Interface Commands-Router(config-if) #

ip address  
ipv6 address  
encapsulation  
shutdown/ no shutdown  
etc.

router rip  
ospf  
eigrp  
etc.

### Routing Engine Commands-Router(config-router) #

network  
version  
auto summary  
etc.

line vty  
console  
etc.

### Line Commands-Router(config-line) #

password  
login  
modem commands  
etc.

# Primary Modes

## User EXEC Mode

Limited examination of router.  
Remote access.

```
Switch>  
Router>
```

The **User EXEC** mode allows only a limited number of basic monitoring commands and is often referred to as view-only mode.

## Privileged EXEC Mode

The **Privileged EXEC** mode, by default, allows all monitoring commands, as well as execution of configuration and management commands.

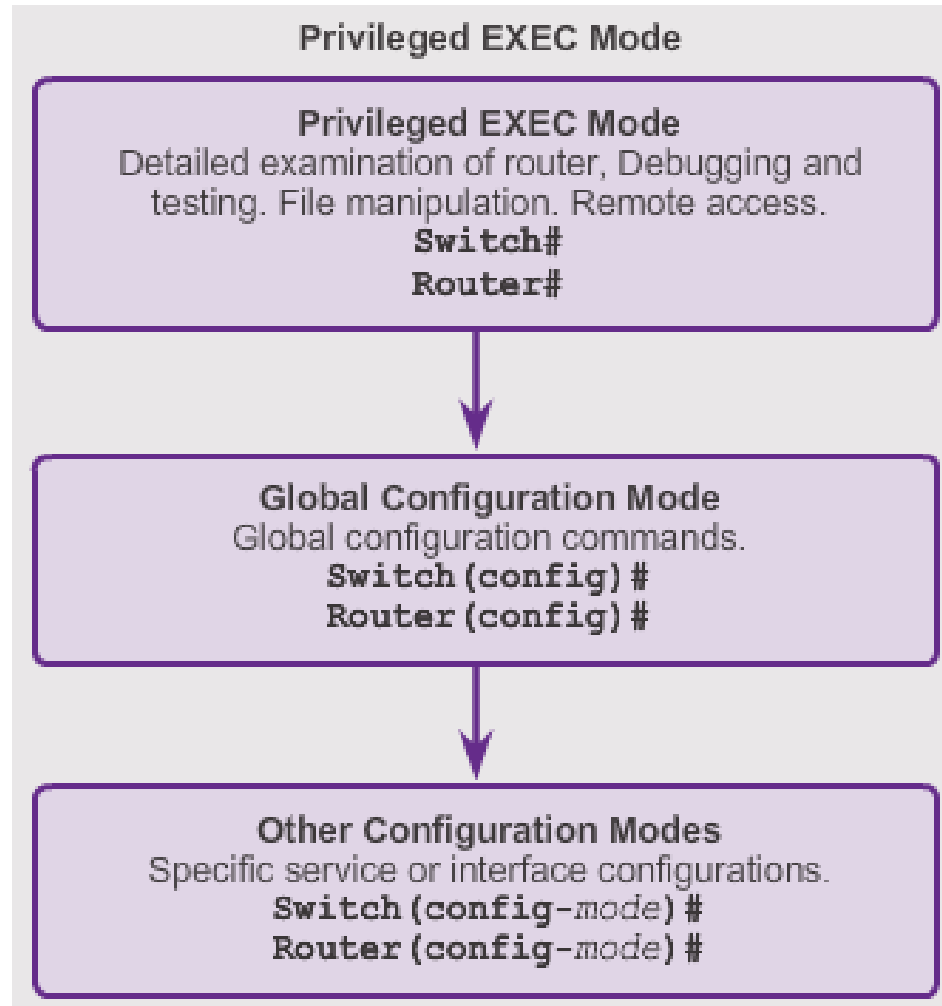

Detailed examination of router.  
Debugging and testing. File manipulation.  
Remote access.

```
Switch#  
Router#
```

# Global Configuration Mode and Submodes

Within Privileged EXEC mode, network administrators can access the global configuration mode and all other sub-configuration modes.

# Global Configuration Mode and Submodes

IOS Prompt Structure

```
Router>ping 192.168.10.5  
  
Router#show running-config  
  
Router (config) #Interface FastEthernet 0/0  
  
Router (config-if) #ip address 192.168.10.1 255.255.255.0
```

The prompt changes to denote the current CLI mode.

```
Switch>ping 192.168.10.9  
  
Switch#show running-config  
  
Switch (config) #Interface FastEthernet 0/1  
  
Switch (config-if) #Description connection to WEST LAN4
```

# Navigating Between IOS Modes

- Configuration Mode

# The Command Structure

Basic IOS  
Command  
Structure

# Basic IOS Command Structure

# Cisco IOS Command Reference

- For the **ping** command:

```
Switch> ping IP-address
```

```
Switch> ping 10.10.10.5
```

The command is **ping** and the user defined argument is the **10.10.10.5**.

- Similarly, the syntax for entering the **traceroute** command is:

```
Switch> traceroute IP-address
```

```
Switch> traceroute 192.168.254.254
```

The command is **traceroute** and the user defined argument is the **192.168.254.254**.

# Context-Sensitive Help

## Context Sensitive Help

```
Switch#cl?  
clear clock
```

Command options - display a list of commands or keywords that start with the characters **cl**

```
Switch#clock set ?  
hh:mm:ss Current Time
```

Command explanation - the IOS displays what command arguments or variables can be next, and provides an explanation of each

```
Switch#clock set 19:50:00 ?  
<1-31> Day of the month  
MONTH Month of the year
```

Command explanation with more than one argument or variable option

```
Switch#clock set 19:50:00 25 June 2012  
Switch#
```

# Command Syntax Check

```
Switch#>clock set  
% Incomplete command.  
Switch#clock set 19:50:00  
% Incomplete command.
```

The IOS returns a help message indicating that required keywords or arguments were left off the end of the command.

```
Switch#c  
% Ambiguous command: 'c'
```

The IOS returns a help message to indicate that there were not enough characters entered for the command interpreter to recognize the command.

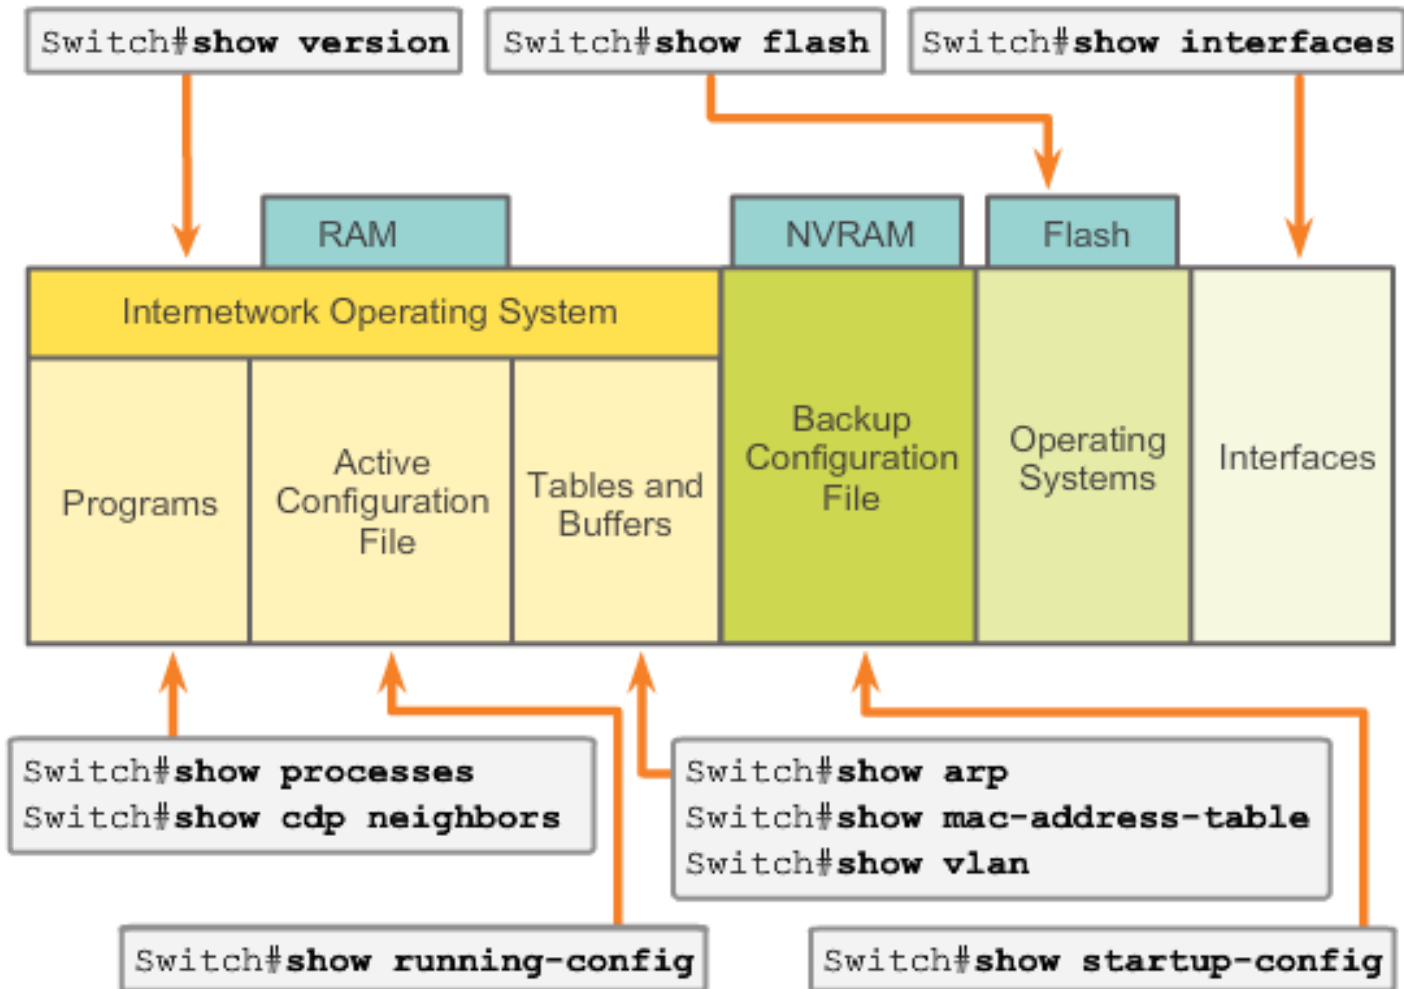

```
Switch#clock set 19:50:00 25 6  
^  
% Invalid input detected at '^'  
marker.
```

The IOS returns a "^" to indicate where the command interpreter can not decipher the command.

# Hot Keys and Shortcuts

- **Tab** - Completes the remainder of a partially typed command or keyword
- **Ctrl-R** - Redisplays a line
- **Ctrl-A** – Moves cursor to the beginning of the line
- **Ctrl-Z** - Exits configuration mode and returns to user EXEC
- **Down Arrow** - Allows the user to scroll forward through former commands
- **Up Arrow** - Allows the user to scroll backward through former commands
- **Ctrl-Shift-6** - Allows the user to interrupt an IOS process such as **ping** or **traceroute**.
- **Ctrl-C** - Aborts the current command and exits the configuration mode

# IOS Examination Commands

# The “show version” Command

```
Router#show version
Cisco IOS Software, C1900 Software (C1900-UNIVERSALK9-M), Version
15.2(4)M1, RELEASE SOFTWARE (fc1)
Technical Support: http://www.cisco.com/techsupport
Copyright (c) 1986-2012 by Cisco Systems, Inc.
Compiled Thu 26-Jul-12 19:34 by prod_rel_team

ROM: System Bootstrap, Version 15.0(1r)M15, RELEASE SOFTWARE (fc1)

cisco1941 uptime is 41 minutes
System returned to ROM by power-on
System image file is ""flash0:c1900-universalk9-mz.SPA.152-
4.M1.bin""
Last reload type: Normal Reload
Last reload reason: power-on

# Packet Tracer – Navigating the IOS

Basic Connections  
Accessing the CLI  
Exploring EXEC  
Modes  
Setting the Clock

# Configuring Hostnames

Device  
Names

# Device Names

Hostnames allow devices to be identified by network administrators over a network or the Internet.

Some guidelines for naming conventions are that names should:

- Start with a letter
- Contain no spaces
- End with a letter or digit
- **Use only letters, digits, and dashes**
- Be less than 64 characters in length

# Configuring Hostnames

Configure the switch hostname to be 'Sw-Floor-1'.

```
Switch# configure terminal
```

Enter configuration commands, one per line. End with CNTL/Z.

```
Switch(config)# hostname Sw-Floor-1
```

```
Sw-Floor-1(config)#
```

You successfully configured the switch hostname.

# Limiting Access to Device Configurations

Securing  
Device  
Access

# Securing Device Access

- Enable Password
- Enable Secret
- Console Password
- VTY Password

# Securing Privilege EXEC Access

```
Sw-Floor-1>enable
Sw-Floor-1#
Sw-Floor-1#conf terminal
Sw-Floor-1(config)#enable secret class
Sw-Floor-1(config)#exit
Sw-Floor-1#
Sw-Floor-1#disable
Sw-Floor-1>enable
Password:
Sw-Floor-1#
```

- use the **enable secret** command, not the older **enable** password command
- **enable secret** provides greater security because the password is encrypted

# Securing User EXEC Access

```
Sw-Floor-1 (config) #line console 0
Sw-Floor-1 (config-line) #password cisco
Sw-Floor-1 (config-line) #login
Sw-Floor-1 (config-line) #exit
Sw-Floor-1 (config) #
Sw-Floor-1 (config) #line vty 0 15
Sw-Floor-1 (config-line) #password cisco
Sw-Floor-1 (config-line) #login
Sw-Floor-1 (config-line) #
```

- **Console port** must be secured
  - Reduces the chance of unauthorized personnel physically plugging a cable into the device and gaining device access
- **VTY lines** allow access to a Cisco device via Telnet

# Securing Device Access

- Enable Password
- Enable Secret
- Console Password
- VTY Password

# Physical Layer Protocols

Connecting  
to the  
Network

# Connecting to the Network

## Home Router

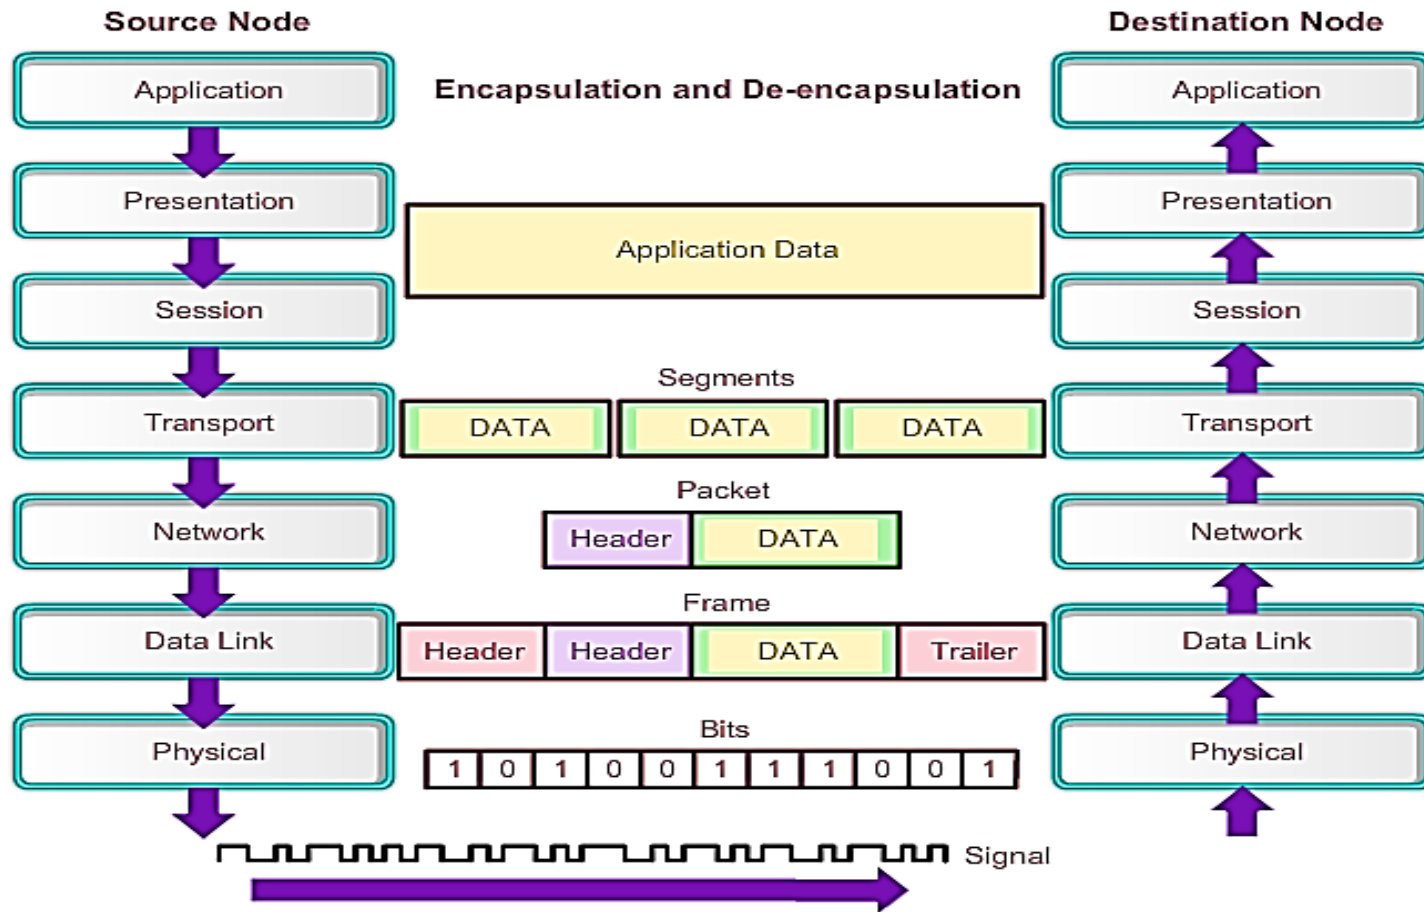

A physical connection can be a wired connection using a cable or a wireless connection using radio waves.

# Network Interface Cards

- Network Interface Cards (NICs) connect a device to the network.
- Ethernet NICs are used for a wired connection whereas WLAN (Wireless Local Area Network) NICs are used for wireless.

# Purpose of Physical Layer

The OSI physical layer provides the means to transport the bits that make up a data link layer frame across the network media.

# Physical Layer Media

Sample electrical signals transmitted on copper cable

Representative light pulse fiber signals

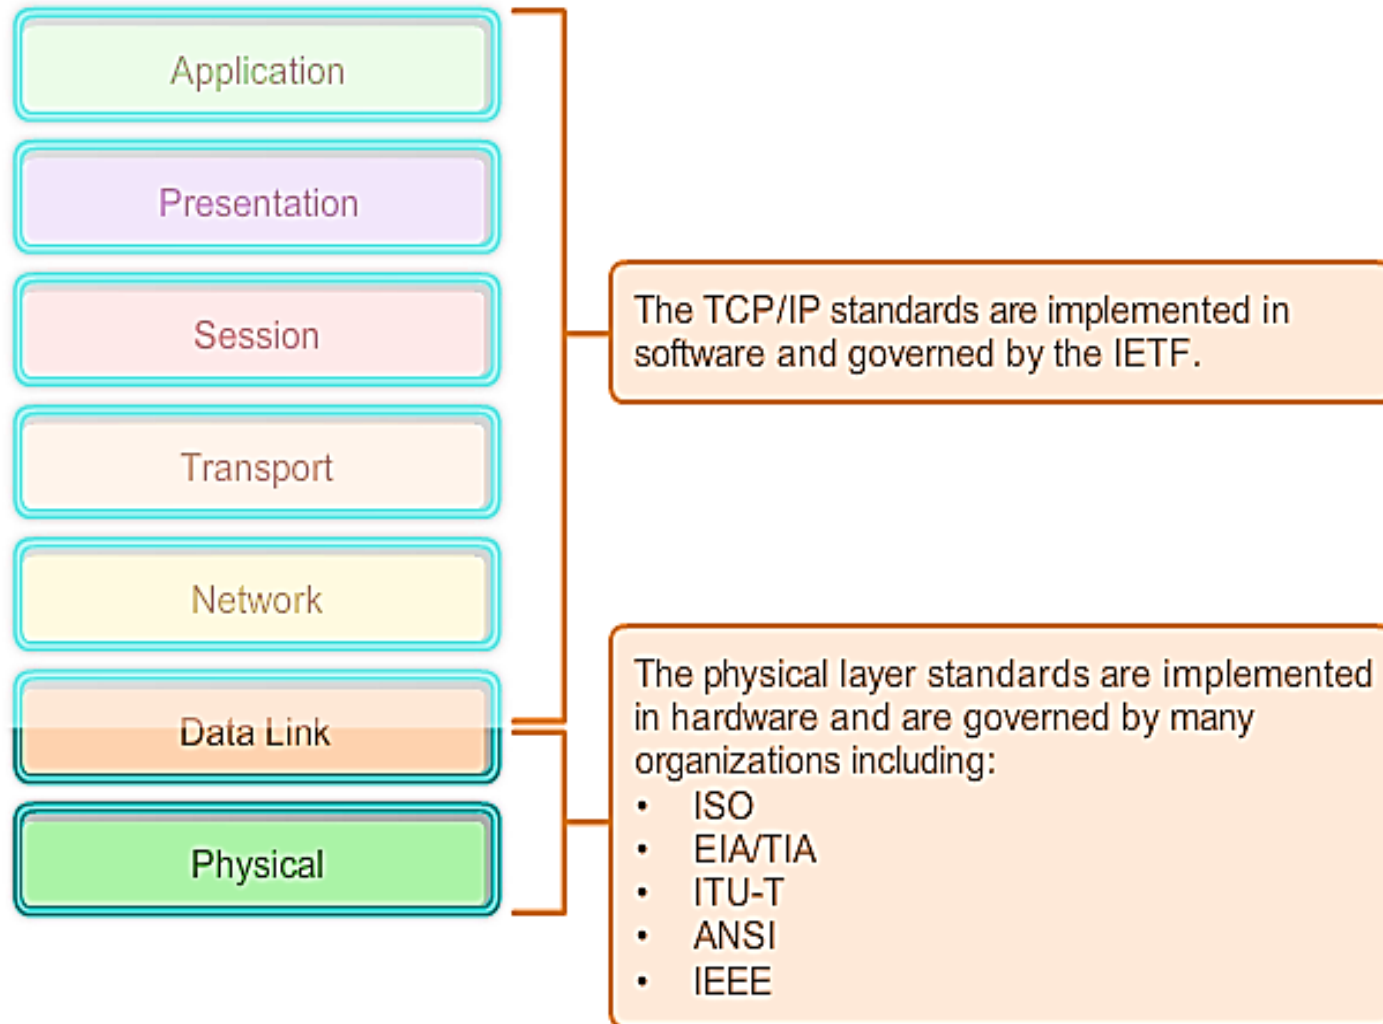

Microwave (wireless) signals

The physical layer produces the representation and groupings of bits for each type of media as:

- **Copper cable:** The signals are patterns of electrical pulses.
- **Fiber-optic cable:** The signals are patterns of light.
- **Wireless:** The signals are patterns of microwave transmissions.

# Physical Layer Standards

# Physical Layer Fundamentals

Bandwidth  
Throughput

# Bandwidth

Unit of Bandwidth	Abbreviation	Equivalence
Bits per second	bps	1 bps = fundamental unit of bandwidth
Kilobits per second	kbps	1 kbps = 1,000 bps = $10^3$ bps
Megabits per second	Mbps	1 Mbps = 1,000,000 bps = $10^6$ bps
Gigabits per second	Gbps	1 Gbps = 1,000,000,000 bps = $10^9$ bps
Terabits per second	Tbps	1 Tbps = 1,000,000,000,000 bps = $10^{12}$ bps

Bandwidth is the capacity of a medium to carry data.

Typically measured in kilobits per second (kb/s) or megabits per second (Mb/s).

# Throughput

- **Throughput** is the measure of the transfer of bits across the media over a given period of time.
- Due to a number of factors, throughput usually does not match the specified bandwidth in physical layer implementations.
- <http://www.speedtest.net/>
- <http://ipv6-test.com/speedtest/>

# Physical Layer Protocols

NICs  
Physical Layer  
Media,  
Standards,  
Fundamentals

# Network Media

Copper Cabling  
UTP Cabling  
Fiber Optic  
Cabling  
Wireless Media

# Copper Media

Unshielded Twisted-Pair (UTP) cable

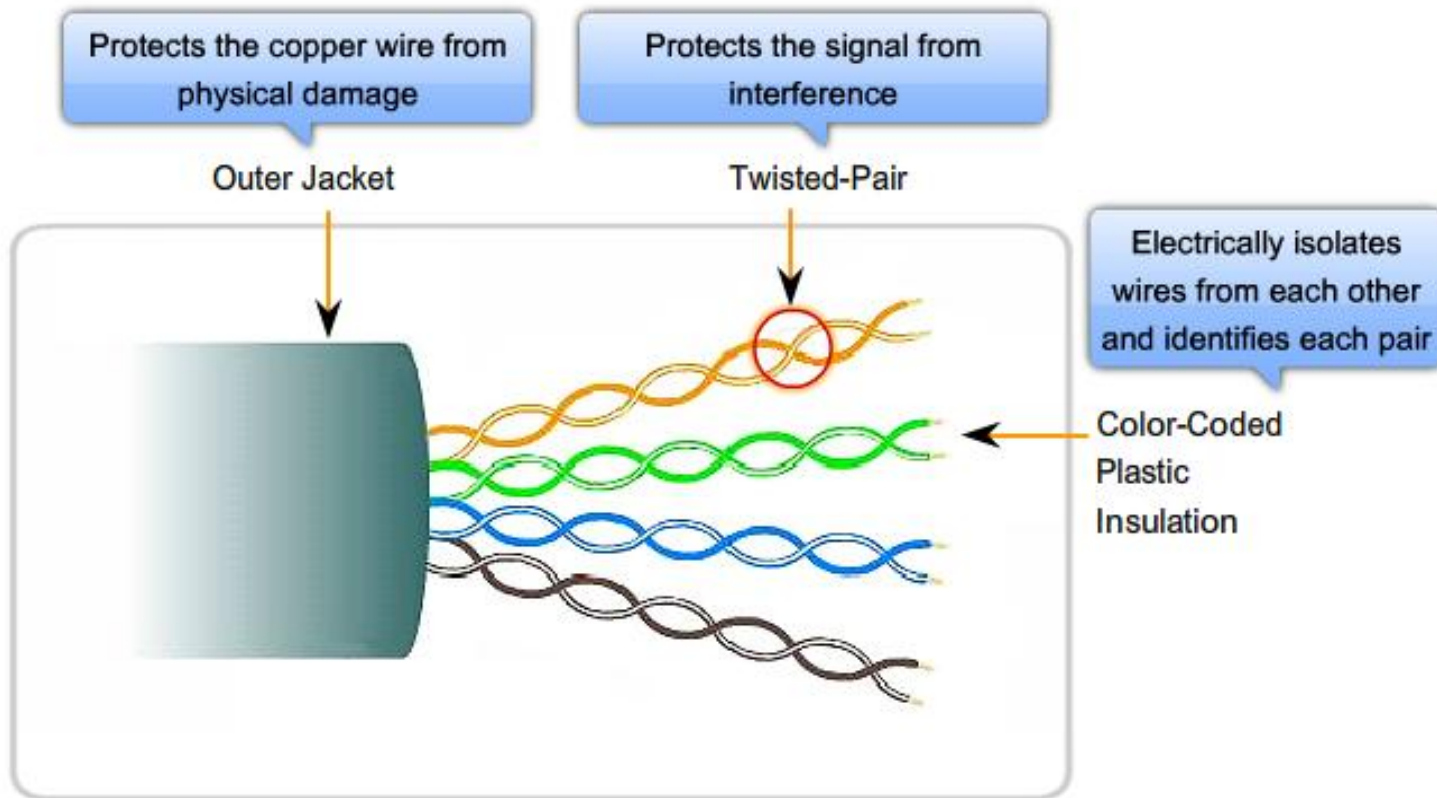

Shielded Twisted-Pair (STP) cable

Coaxial cable

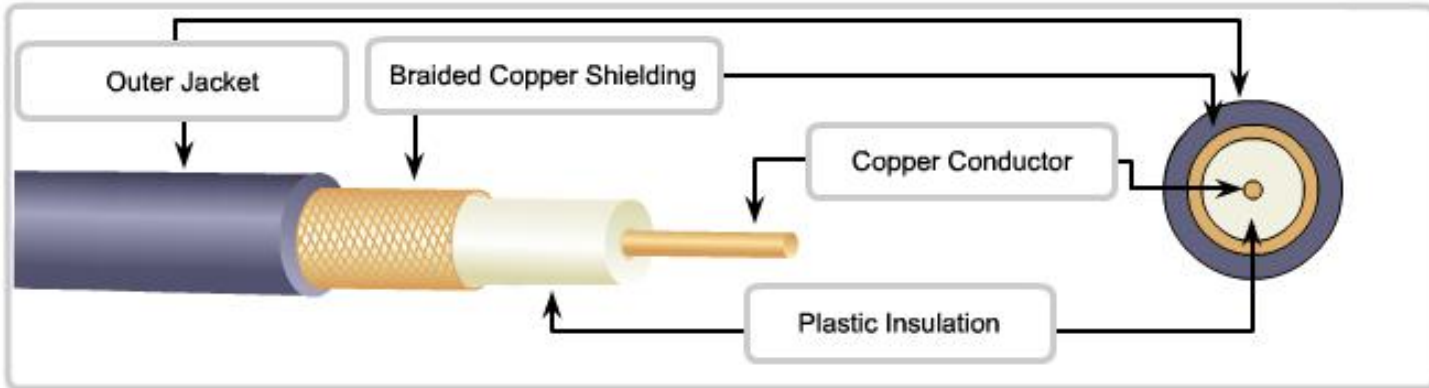

# Unshielded Twisted-Pair Cable

# Shielded Twisted-Pair Cable

# Coaxial Cable

# Copper Media Safety

The separation of data and electrical power cabling must comply with safety codes.

Cables must be connected correctly.

Installations must be inspected for damage.

Equipment must be grounded correctly.

# Fiber Optic Cabling

# Fiber vs. Copper

Implementation issues	Copper media	Fibre-optic
Bandwidth supported	10 Mbps – 10 Gbps	10 Mbps – 100 Gbps
Distance	Relatively short (1 – 100 meters)	Relatively High (1 – 100,000 meters)
Immunity to EMI and RFI	Low	High (Completely immune)
Immunity to electrical hazards	Low	High (Completely immune)
Media and connector costs	Lowest	Highest
Installation skills required	Lowest	Highest
Safety precautions	Lowest	Highest

# Wireless Media

- IEEE 802.11 standards
- Commonly referred to as Wi-Fi
- Uses CSMA/CA
- Variations include:
  - 802.11a: 54 Mb/s, 5 GHz
  - 802.11b: 11 Mb/s, 2.4 GHz
  - 802.11g: 54 Mb/s, 2.4 GHz
  - 802.11n: 600 Mb/s, 2.4, and 5 GHz
  - 802.11ac: 1 Gb/s, 5 GHz
  - 802.11ad: 7 Gb/s, 2.4 GHz, 5 GHz, and 60 GHz

- IEEE 802.15 standard
- Supports speeds up to 3 Mb/s
- Provides device pairing over distances from 1 to 100 meters

- IEEE 802.16 standard
- Provides speeds up to 1 Gb/s
- Uses a point-to-multipoint topology to provide wireless broadband access

# 802.11 Wi-Fi Standards

Standard	Maximum Speed	Frequency	Backwards compatible
802.11a	54 Mbps	5 GHz	No
802.11b	11 Mbps	2.4 GHz	No
802.11g	54 Mbps	2.4 GHz	802.11b
802.11n	600 Mbps	2.4 GHz or 5 GHz	802.11b/g
802.11ac	1.3 Gbps (1300 Mbps)	2.4 GHz and 5.5 GHz	802.11b/g/n
802.11ad	7 Gbps (7000 Mbps)	2.4 GHz, 5 GHz and 60 GHz	802.11b/g/n/ac

# Data Link Layer Protocols

Purpose of  
the Data  
Link Layer

# Purpose of the Data Link Layer

## Data Link Layer

# Data Link Sublayers

Network	
Data Link	LLC Sublayer
	MAC Sublayer
Physical	

**Data Link layer has two sublayers** (sometimes):

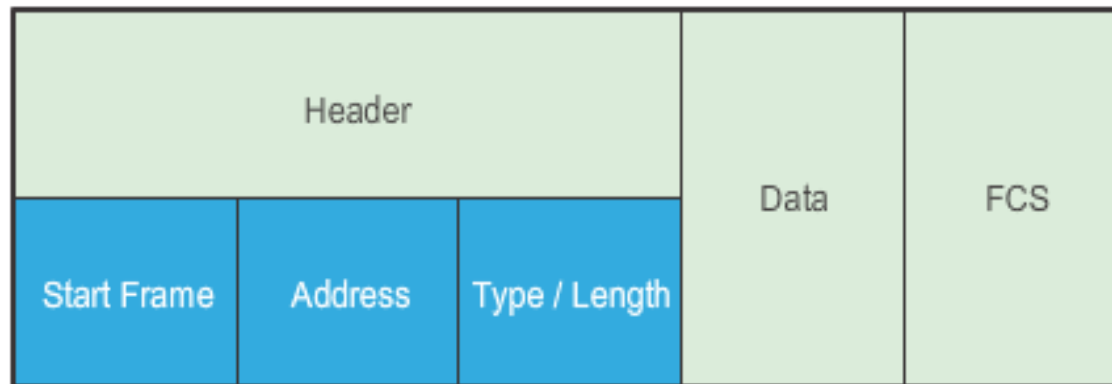

**Logical Link Control (LLC)** – Software processes that provide services to the Network layer protocols.

**Media Access Control (MAC)** - Media access processes performed by the hardware.

Provides Data Link layer addressing and framing of the data according to the protocol in use.

# Data Link Frame Fields - Header

## The Role of the Header

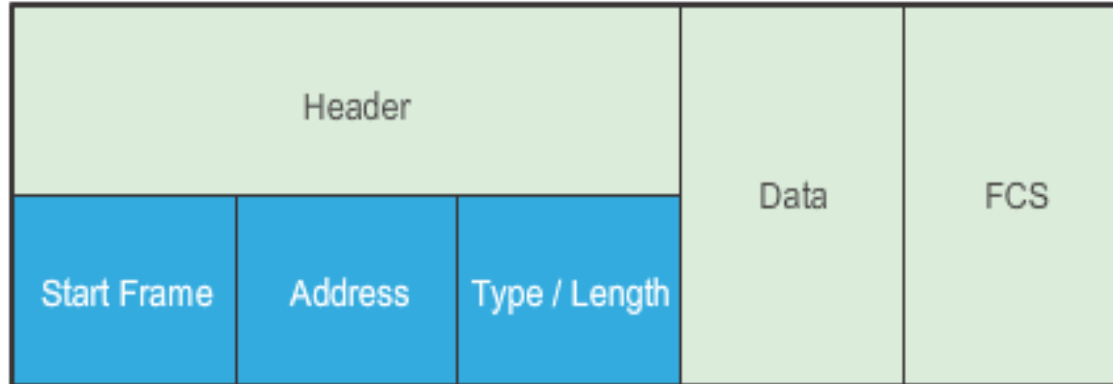

### Start Frame

This field tells other devices on the network that a frame is coming along the medium.

# Data Link Frame Fields - Header

## The Role of the Header

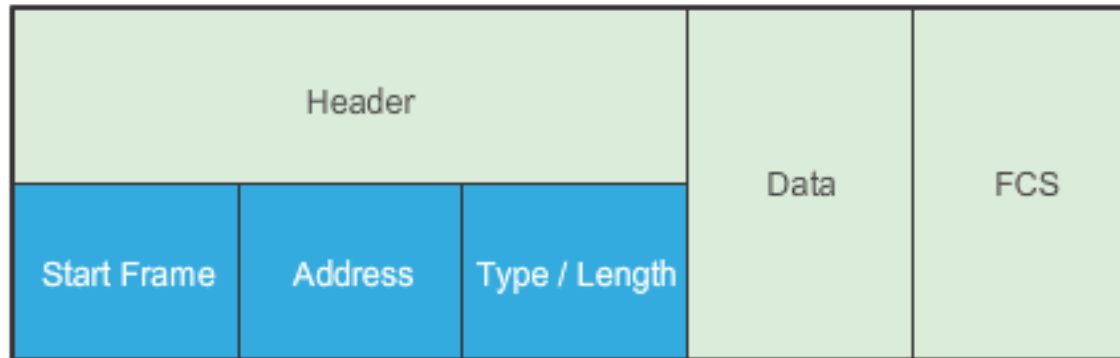

### Address

This field stores the source and destination data link addresses.

# Data Link Frame Fields - Header

## The Role of the Header

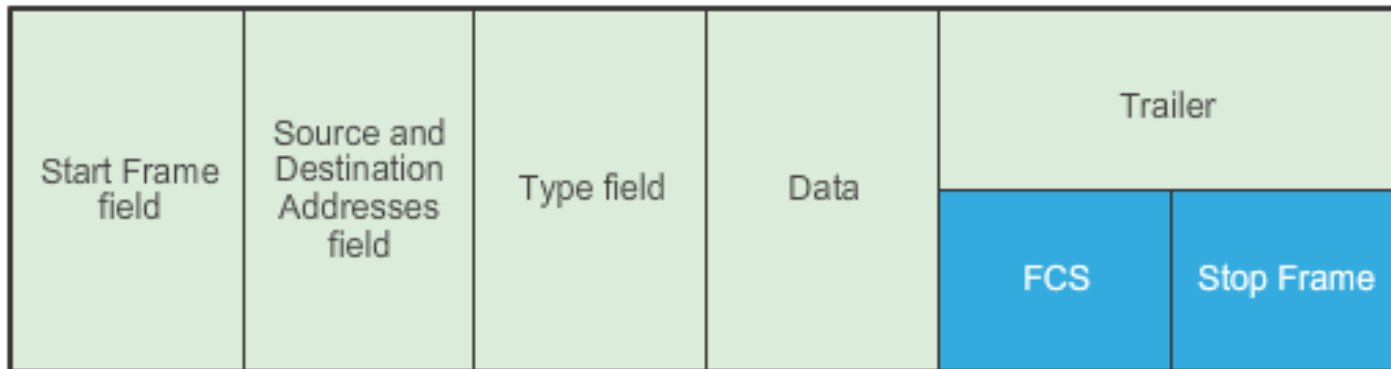

### Type / Length

This field is an optional field used by some protocols to state either what type of data is coming or possibly the length of the frame.

# Data Link Frame Fields – The Trailer

## Frame Trailer

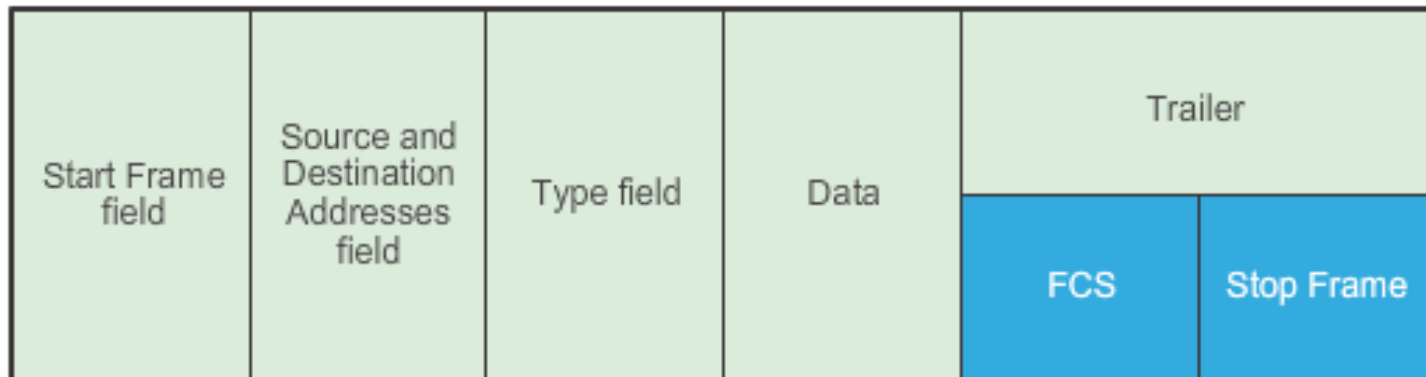

### Frame Check Sequence

This field is used for error checking. The source calculates a number based on the frame's data and places that number in the FCS field. The destination then recalculates the data to see if the FCS matches. If they don't match, the destination deletes the frame.

# Data Link Frame Fields – The Trailer

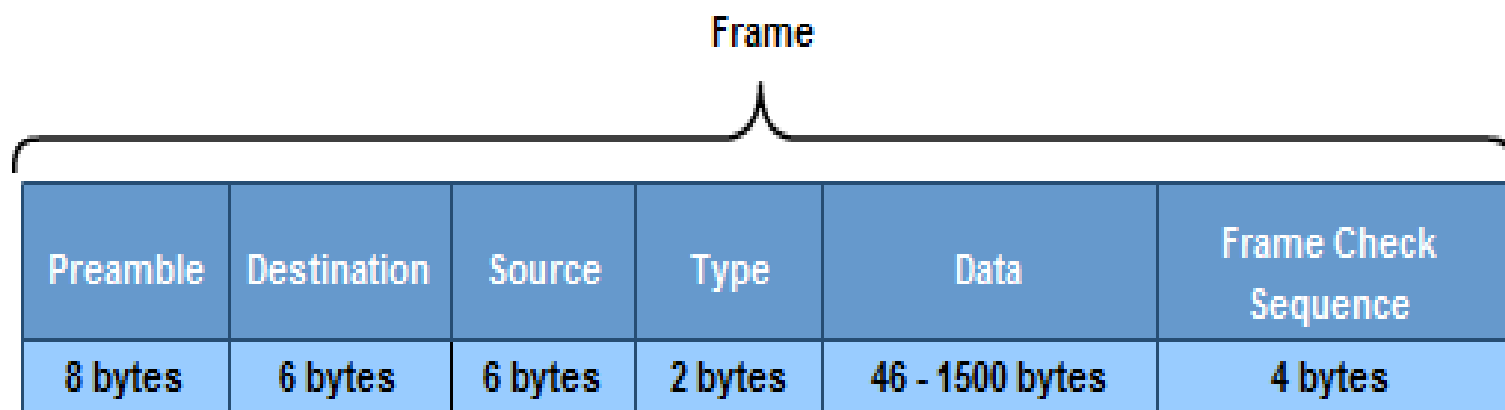

## Frame Trailer

### Stop Frame

This field, also called the Frame Trailer, is an optional field that is used when the length of the frame is not specified in the Type/Length field. It indicates the end of the frame when transmitted.

# Ethernet Protocol for LANs

**Preamble** - Used for synchronization; also contains a delimiter to mark the end of the timing information

**Destination Address** - 48-bit MAC address for the destination node

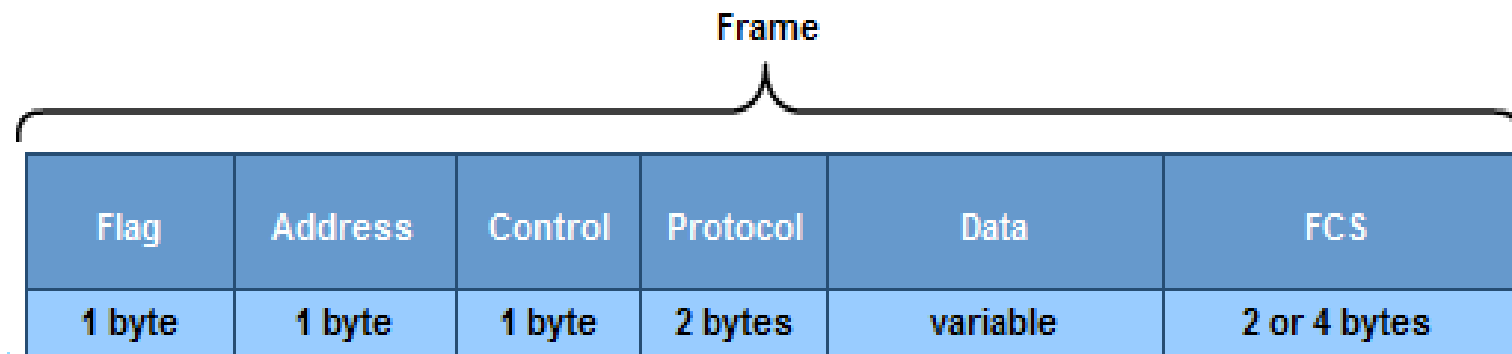

**Source Address** - 48-bit MAC address for the source node

**Type** - Value to indicate which upper layer protocol will receive the data after the Ethernet process is complete

**Data or payload** - This is the PDU, typically an IPv4 packet, that is to be transported over the media.

**Frame Check Sequence (FCS)** - A value used to check for damaged frames

# Point-to-Point Protocol for WANs

**Flag** - A single byte that indicates the beginning or end of a frame. The flag field consists of the binary sequence 01111110.

**Address** - A single byte that contains the standard PPP broadcast address. PPP does not assign individual station addresses.

**Control** - A single byte that contains the binary sequence 00000011, which calls for transmission of user data in an unsequenced frame.

**Protocol** - Two bytes that identify the protocol encapsulated in the data field of the frame. The most up-to-date values of the protocol field are specified in the most recent Assigned Numbers Request For Comments (RFC).

**Data** - Zero or more bytes that contain the datagram for the protocol specified in the protocol field.

**Frame Check Sequence (FCS)** - Normally 16 bits (2 bytes). By prior agreement, consenting PPP implementations can use a 32-bit (4-byte) FCS for improved error detection.

# Media Access Control – Data Link Frame

Data Link Frame  
Ethernet Protocol  
PPP Protocol

# Data Link Layer Protocols

Link Layer  
Sublayers: LLC  
and MAC  
Frame Structure

# Network Layer Protocols

The Network  
Layer

# The Network Layer

- Provides services to allow end devices to exchange data across the network.
- Uses four basic processes:
  1. Addressing end devices
  2. Encapsulation
  3. Routing
  4. De-encapsulation

# Network Layer Protocols

- Common Network Layer Protocols
  - IPv4
  - IPv6
- Legacy Network Layer Protocols
  - Novell Internetwork Packet Exchange (IPX)
  - AppleTalk
  - Connectionless Network Service (CLNS/DECNet)

# Characteristics of IP Protocol

- **Connectionless:**  
No connection is established before sending data packets.
- **Best effort delivery:**  
No additional overhead is used to guarantee packet delivery.
- **Media independent:**  
Operates independently of the medium carrying the data.

# Connectionless Service

A packet is sent.

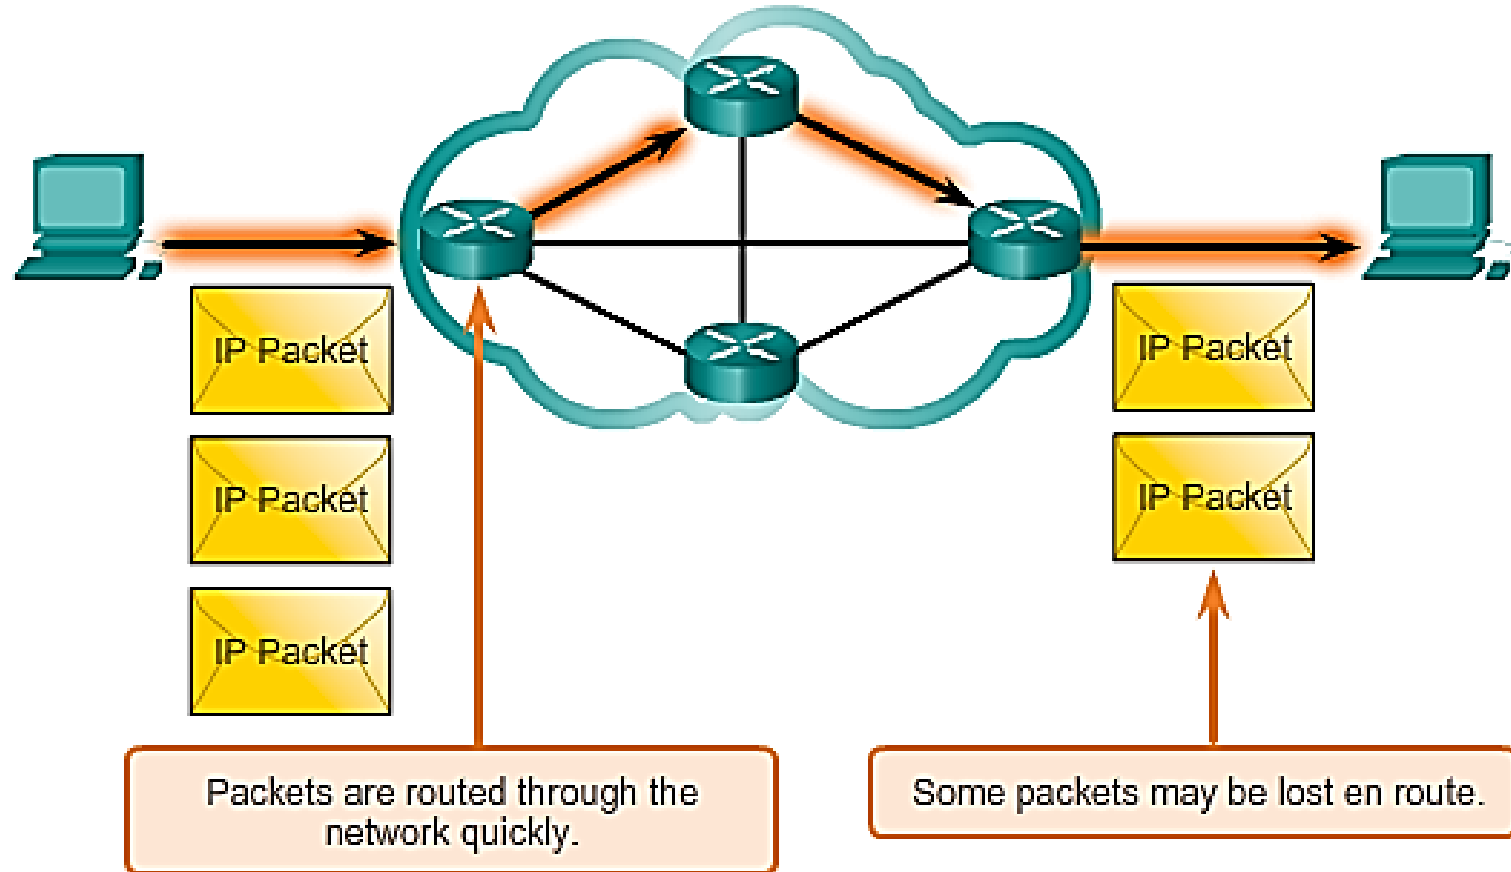

## The sender doesn't know:

- if the receiver is present
- if the letter arrived
- if the receiver can read the letter

## The receiver doesn't know:

- when it is coming

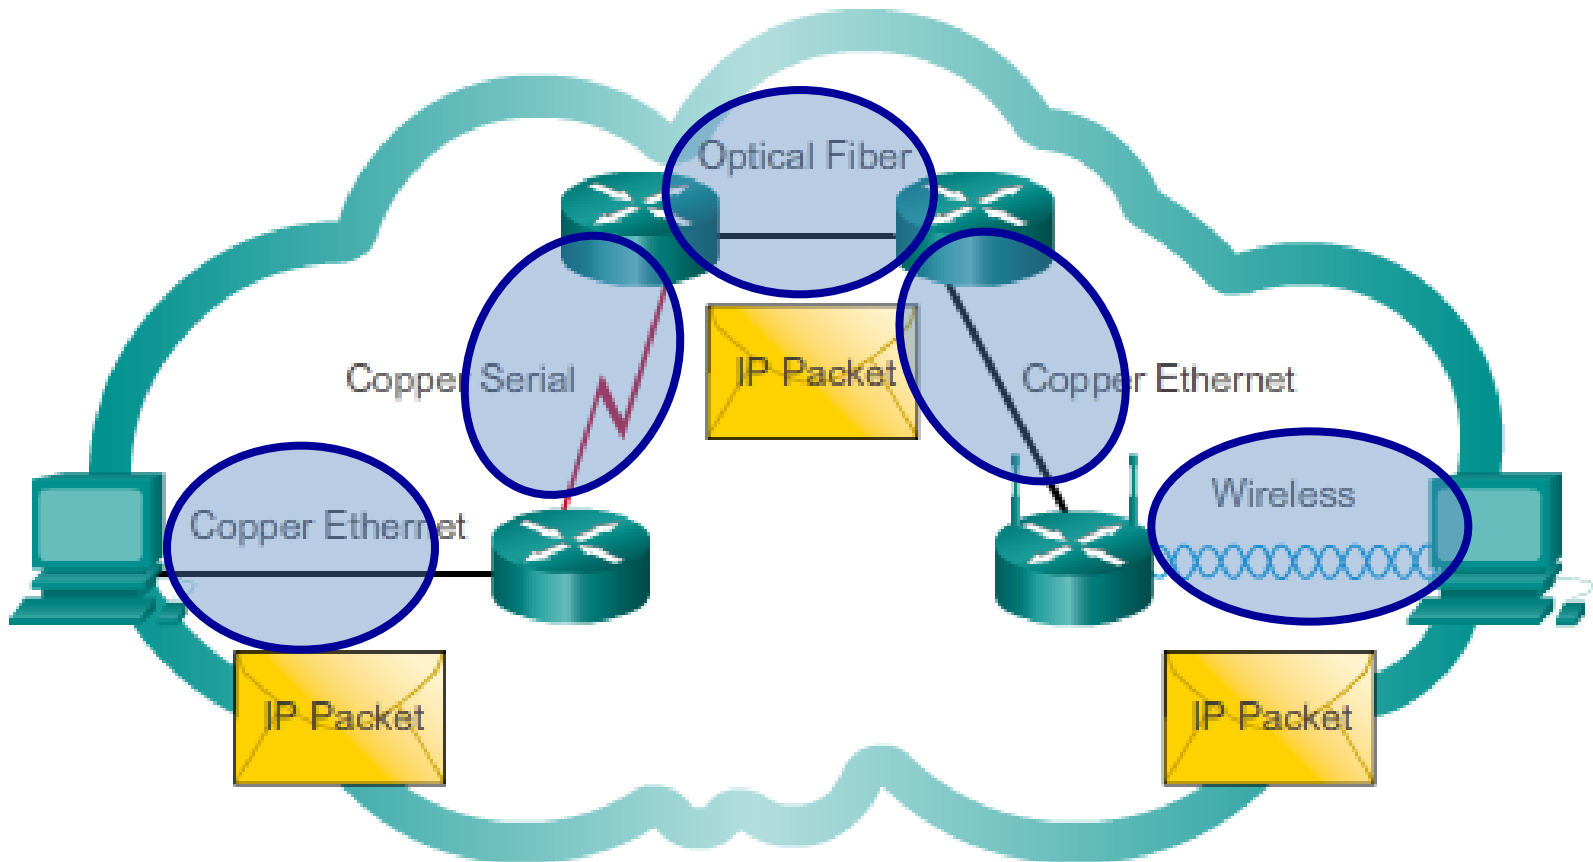

# Best Effort Delivery – Unreliable

As an unreliable network layer protocol, IP does not guarantee that all sent packets will be received. Other protocols manage the process of tracking packets and ensuring their delivery.

# Media Independent

IP packets can travel over different media.

# Network Layer Protocols

Network Layer  
Functions  
IP Characteristics

# IPv4 Packet

## IPv4 Packet Structure

# IPv4 Packet Structure

- An IPv4 packet has two parts:

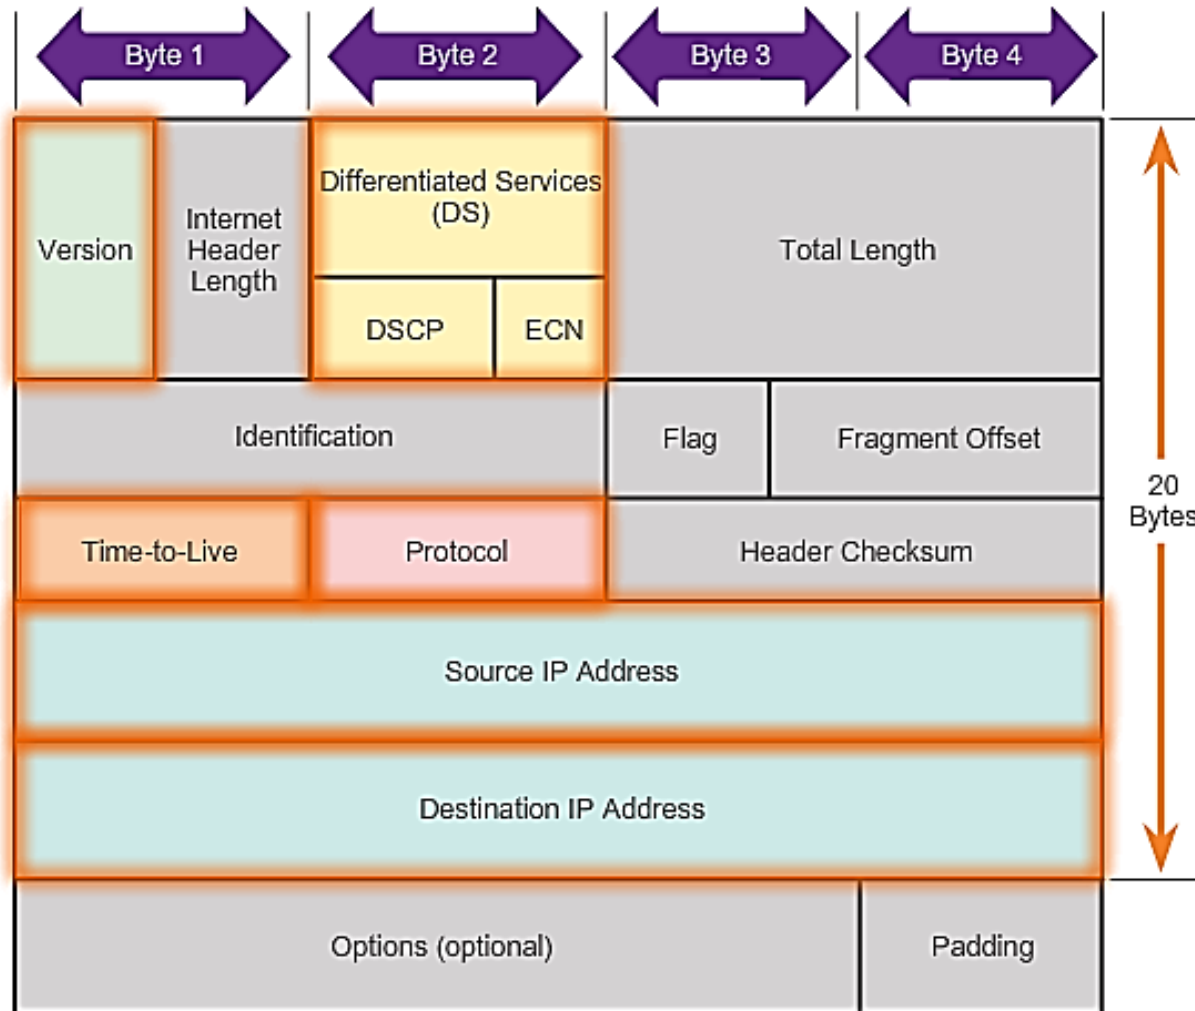

- IP Header -**

- Identifies the packet characteristics.

- Payload -**

- Contains the Layer 4 segment information and the actual data.

# IPv4 Packet Header

# Sample IPv4 Packet

**Differentiated Services (8 bits)**

- Formerly called the Type of Service (ToS) field.
- The field is used to determine the priority of each packet.
- First 6 bits identify the Differentiated Services Code Point (DSCP) value for QoS.
- Last 2 bits identify the explicit congestion notification (ECN) value used to prevent dropped packets during times of network congestion.

## Total Length (16 bits)

- Sometimes referred to as the Packet Length.
- Defines the entire packet (fragment) size, including header and data, in bytes.
- The minimum length packet is 20 bytes (20-byte header + 0 bytes data) and the maximum is 65,535 bytes. .

Internet Protocol Version 4 (ip), 20 bytes

Packets: 16 Displayed

A router may have to fragment a packet when forwarding it from one medium to another medium that has a smaller MTU.

When this happens, fragmentation occurs and the IPv4 packet uses the following 3 fields to keep track of the fragments

# Sample IPv4 Packet

Microsoft: \\Device\NPF\_{7BB3C130-30C5-4419-B79E-C0868085ABED} [Wireshark 1.8.2 (SVN Rev 44520 from /trunk-1.8)]

## Identification (16 bits)

- Field uniquely identifies the fragment of an original IP packet.

# Sample IPv4 Packet

The screenshot displays a Wireshark interface with the following details:

- Filter:** [Empty]
- Packet List:**

No.	Time	Source	Destination
1	0.00000000	fe80::b1ee:c4ae:a11ff02::c	
2	0.30588900	192.168.1.109	192.168.1.1
3	0.30723400	192.168.1.109	192.168.1.1
4	0.31007200	192.168.1.1	192.168.1.10
5	0.31018800	192.168.1.109	192.168.1.1
6	0.31092800	192.168.1.1	192.168.1.10
7	0.31103000	192.168.1.109	192.168.1.1
8	0.35044400	192.168.1.109	192.168.1.1
- Packet Details:**
  - Frame 2: 66 bytes on wire (528 bits), 66 bytes captured (528 bits) on interface 0
  - Ethernet II, Src: IntelCor\_45:5d:c4 (24:77:03:45:5d:c4), Dst: 08:00:27:00:00:00
  - Internet Protocol Version 4, Src: 192.168.1.109, Dst: 192.168.1.1
    - Version: 4
    - Header length: 20 bytes
    - Differentiated Services Field: 0x00 (DSCP 0x00, ECN 0000)
    - Total Length: 52
    - Identification: 0x21fc (12796)
    - Flags: 0x02 (Don't Fragment)
    - Fragment offset: 0
    - Time to live: 128
    - Protocol: TCP (6)
    - Header checksum: 0x455d
    - Source: 192.168.1.109
    - Destination: 192.168.1.1
    - [Source GeoIP: Unknown]
    - [Destination GeoIP: Unknown]
  - Transmission Control Protocol, Src Port: 4444, Dst Port: 80
- Packet Bytes:**

0000	00 18 39 a0 d1 be 24
0010	00 34 31 fc 40 00 80
0020	01 01 db 11 00 50 ad
0030	20 00 0b 5c 00 00 00
0040	04 02

**Flag (3 bits)**

- This 3-bit field identifies how the packet is fragmented.
- It is used with the Fragment Offset and Identification fields to help reconstruct the fragment into the original packet.

8	0.35044400	192.168.1.109	192.168.1.1				

Time-To-Live	Protocol	Header Checksum
128	TCP	0x4509

Source IP Address
192.168.1.109

Time-to-Live (TTL) (8 bits)
128

- Used to limit the lifetime of a packet.
- It is specified in seconds but is commonly referred to as hop count.
- If the TTL field decrements to zero, the router discards the packet and sends an ICMP Time Exceeded message to the source IP address.

Internet Protocol Version 4 (p), 20 bytes

## Protocol (8 bits)

- Field indicates the data payload type that the packet is carrying, which enables the network layer to pass the data to the appropriate upper-layer protocol.
- Common values include ICMP (1), TCP (6), and UDP (17).
- Others: GRE (47), ESP (50), EIGRP (88), OSPF (89)
- <http://www.iana.org/assignments/protocol-numbers/>

# Sample IPv4 Packet

The image shows a Wireshark capture of an IPv4 packet. The packet list pane shows 8 packets, with packet 2 selected. The packet details pane shows the structure of the IPv4 header, and the packet bytes pane shows the raw hex data.

## Header Checksum (16 bits)

- Field is used for error checking of the IP header.
- The checksum of the header is recalculated and compared to the value in the checksum field.
- If the values do not match, the packet is discarded.

Internet Protocol Version 4 (ip), 20 bytes      Packets: 1

**Destination IP Address (32 bits)**

- Contains a 32-bit binary value that represents the destination IP address of the packet.

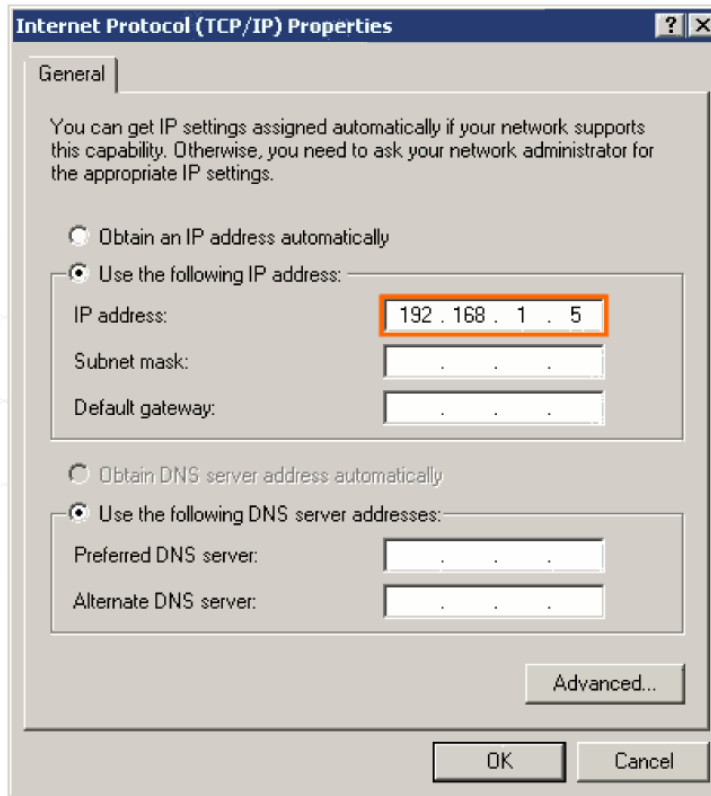

# IPv4 Packet

IPv4 Packet  
Header

# IPv4 Address and Subnet Mask

## IPv4 Address Structure

# IPv4 Address Structure

I see you have assigned me an IP address  
**11000000.1010  
1000.00000001.  
00000101**  
Now other hosts can find me!

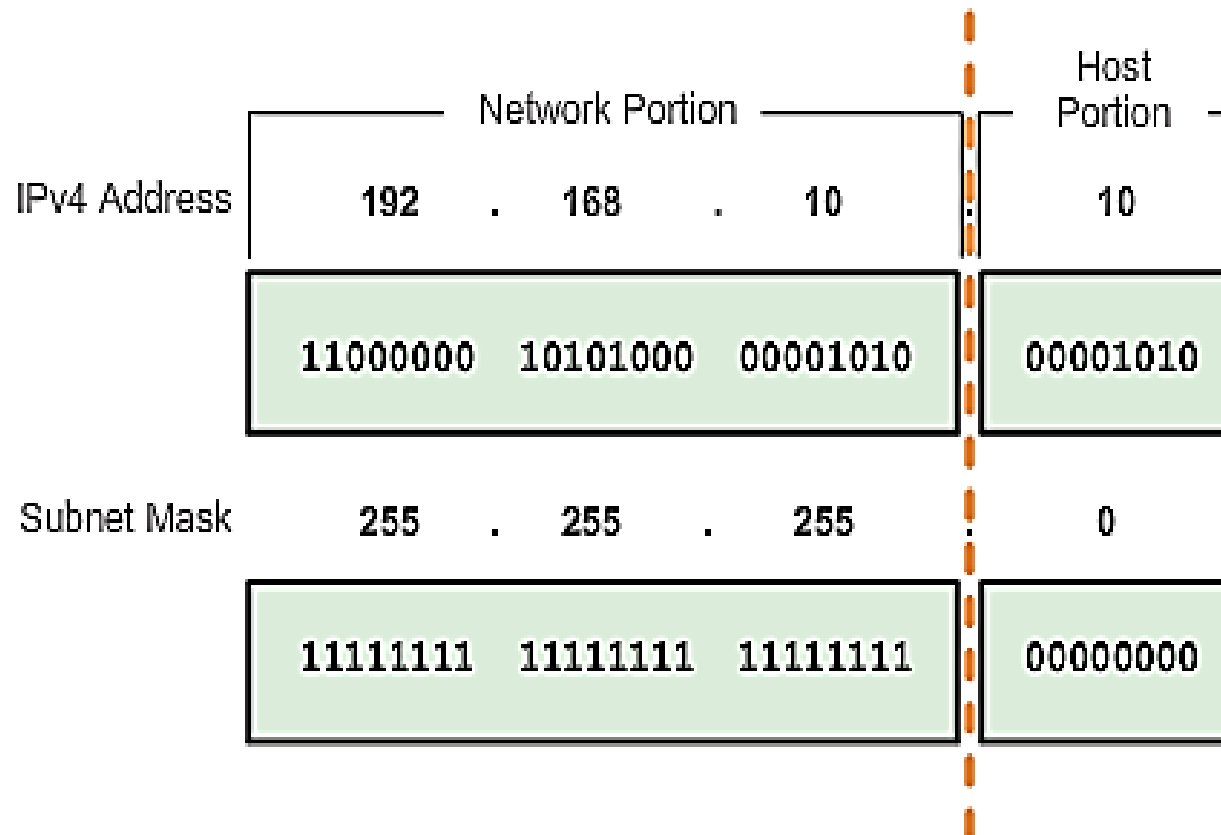

IP version 4 (IPv4) is the current form of addressing used on the Internet.

We look at IP addresses using the “*dotted decimal format*” but network devices only understand the binary format.

**11000000 . 10101000 . 00000001 . 00000101**

# IPv4 Subnet Mask

# Prefix Length

Subnet Mask: 192.168.11.10  
255.255.255.0

The subnet mask identifies which part of the IP address refers to the network.

- The prefix length is the number of bits set to 1 in the subnet mask.
- For example:
  - IP address: **192.168.11.10 255.255.255.0**
  - Is the same as: **192.168.11.10 /24**

# IPv4 Subnet Mask

So how do hosts figure out which part of the address is the network portion?

Hosts compare the IP address and the subnet mask.

- “**1**” bits refer to the network portion.
- “**0**” bits refer to the host portion.

This tells them what network they belong to.

# Types of Addresses in a Network

- Network Address
- Host Address
- Broadcast Address

# Network Address 10.1.1.0/24

- All devices in the network have the same network bits.
  - ***The network address has all 0 bits in the host portion.***

# Broadcast Address 10.1.1.255/24

- A broadcast address is used to send data to all hosts in the network.
  - ***The broadcast address has all 1 bits in the host portion.***

# Host Address 10.1.1.10/24

- In IPv4 addresses, **host addresses are the addresses between the network address and the broadcast address** in that network.

# 1<sup>st</sup> Host Address

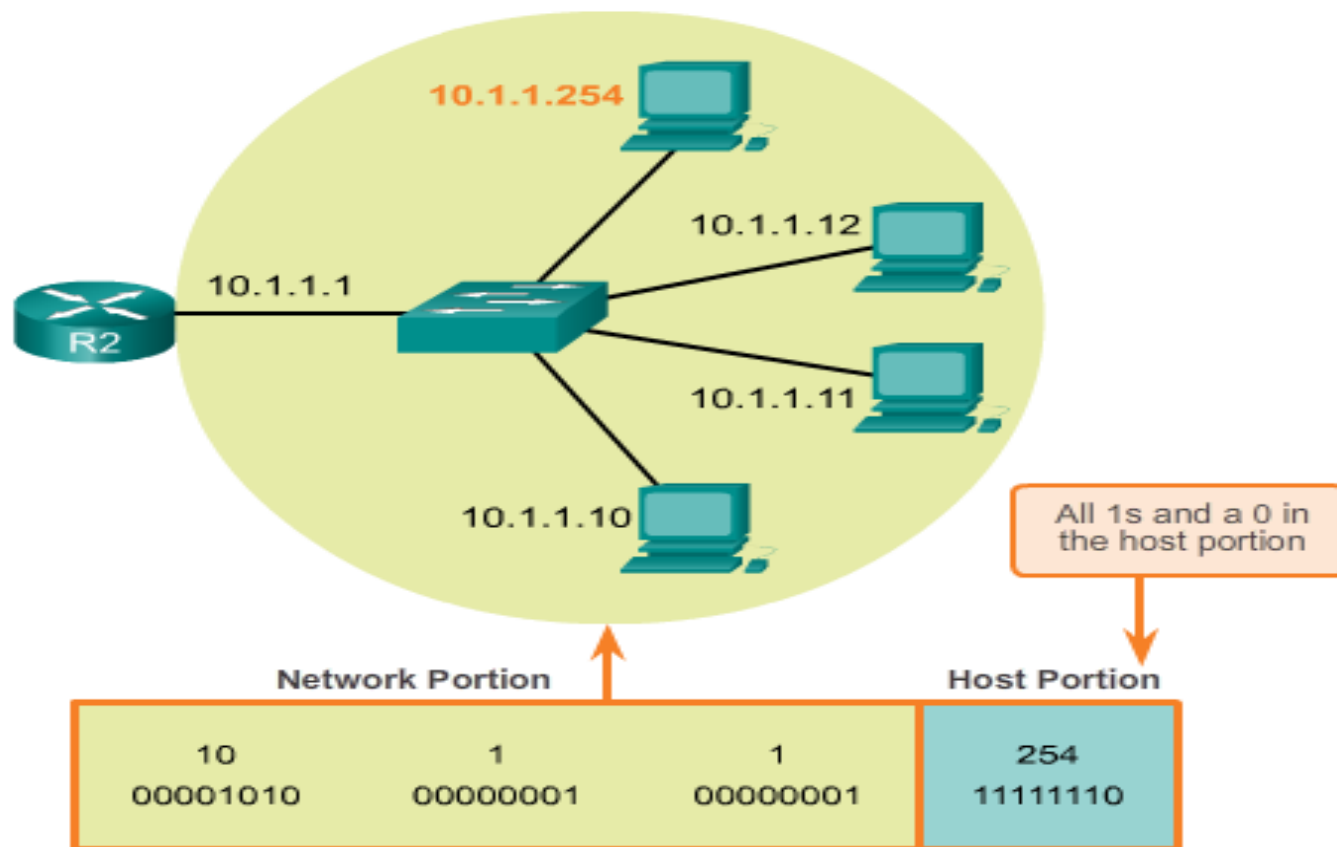

## NOTE:

It is common in many addressing schemes to use the first host address for the router or default gateway address.

- The host portion of the first host address will contain all 0 bits with a 1 bit for the lowest order or right-most bit. ("All 0's and a 1.")
  - For example the first host address is 10.1.1.1 /24.

# Last Host Address

- The host portion of the last host address will contain all 1 bits with a 0 bit for the lowest order or right-most bit. (“All 1’s and a 0.”)
  - For example, the last host address is 10.1.1.254.

# Bringing it All together

Network Address

# IPv4 Address and Subnet Mask

IPv4 Address  
Subnet Mask  
Types of  
Addresses

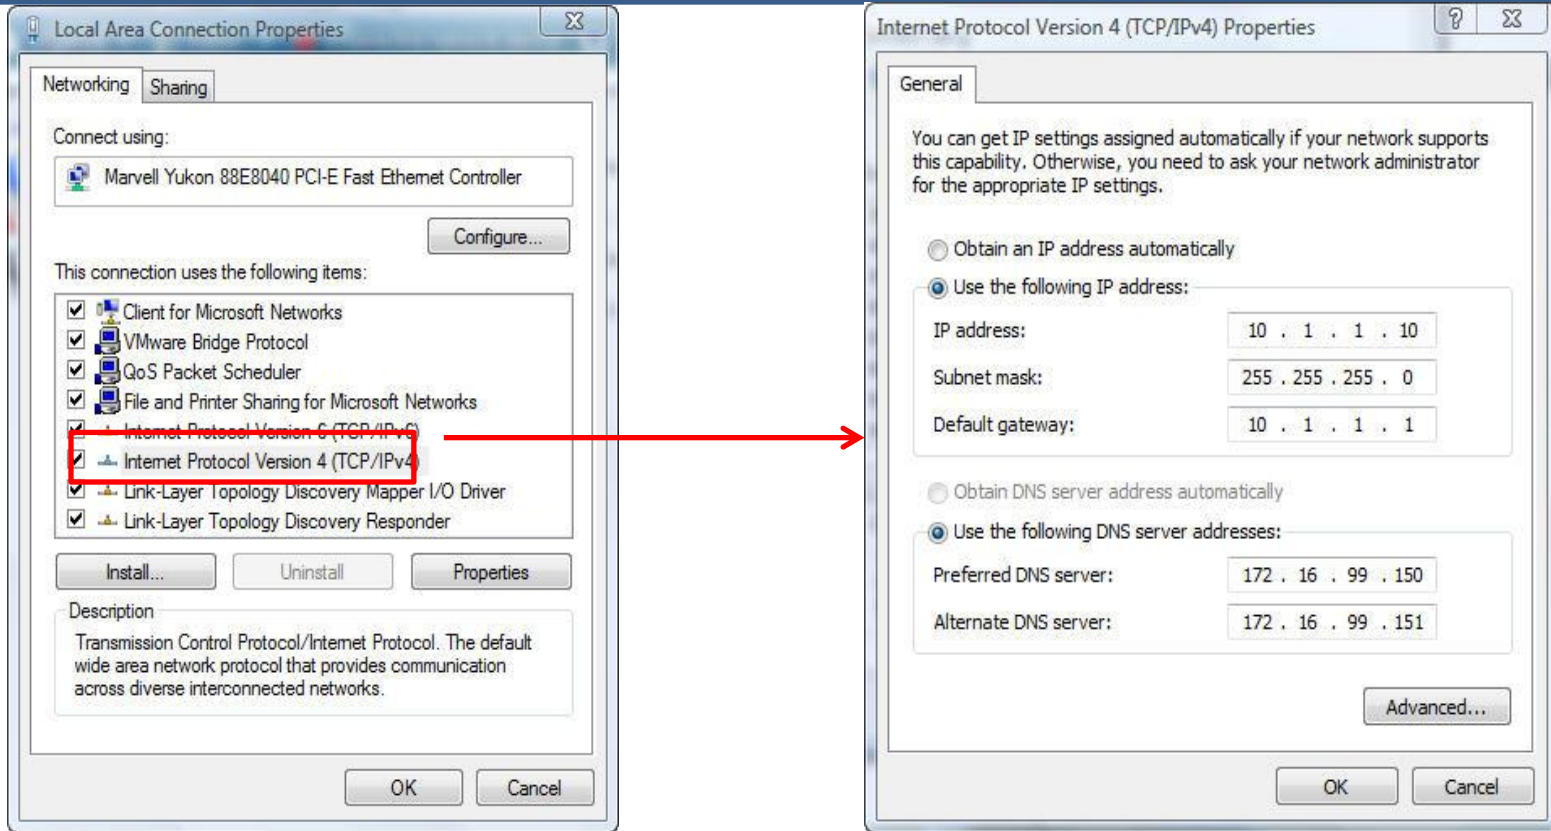

# IPv4 Unicast, Broadcast, and Multicast

Addresses for  
User Devices

# Addresses for User Devices

- Static Assignment
- Dynamic Assignment

# Assigning a Static IPv4 Address to a Host

- Useful for printers, servers, and other networking devices that do not change location often and need to be accessible to clients on the network based on a fixed IP address.
- However, static addressing can be time-consuming to enter on each host.

# Destination Unicasts, Broadcasts and Multicasts

## Source IP Addresses are always unicast

- **Unicasts:**

Packet travels from one host to another specific host.

- **Multicasts:**

Packet travels from one host to a select number of other hosts.

Supports voice and audio broadcasts, news feeds.

- **Broadcasts:**

Packet travels from one host to all hosts on the local network.

# Unicast Addresses

## Unicast Transmission

Source: 172.16.4.1

Destination: 172.16.4.253

# Multicast Addresses

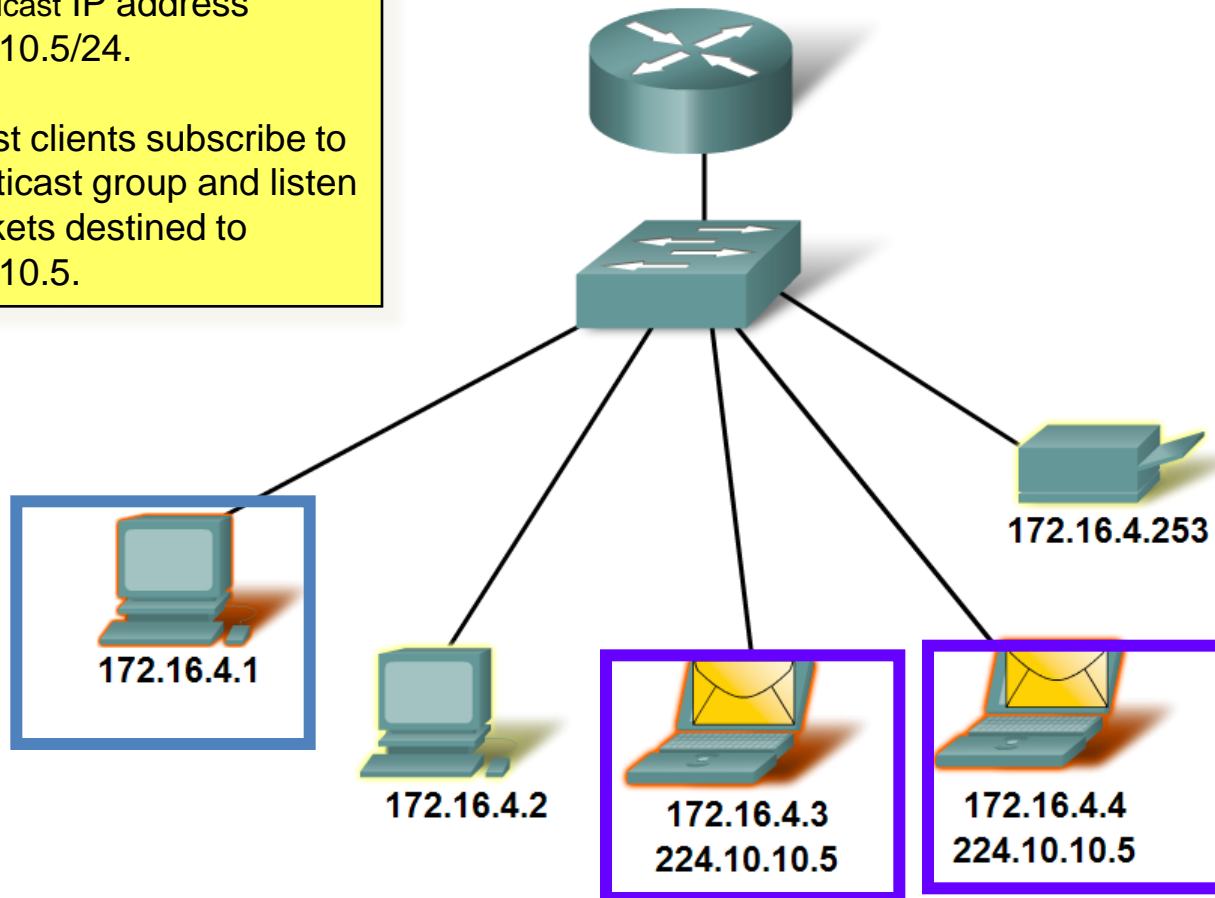

## Multicast Transmission

Source: 172.16.4.1  
Destination: 224.10.10.5

### For example:

One hosts sends packets to the multicast IP address 224.10.10.5/24.

Multicast clients subscribe to the multicast group and listen for packets destined to 224.10.10.5.

# Broadcast Addresses

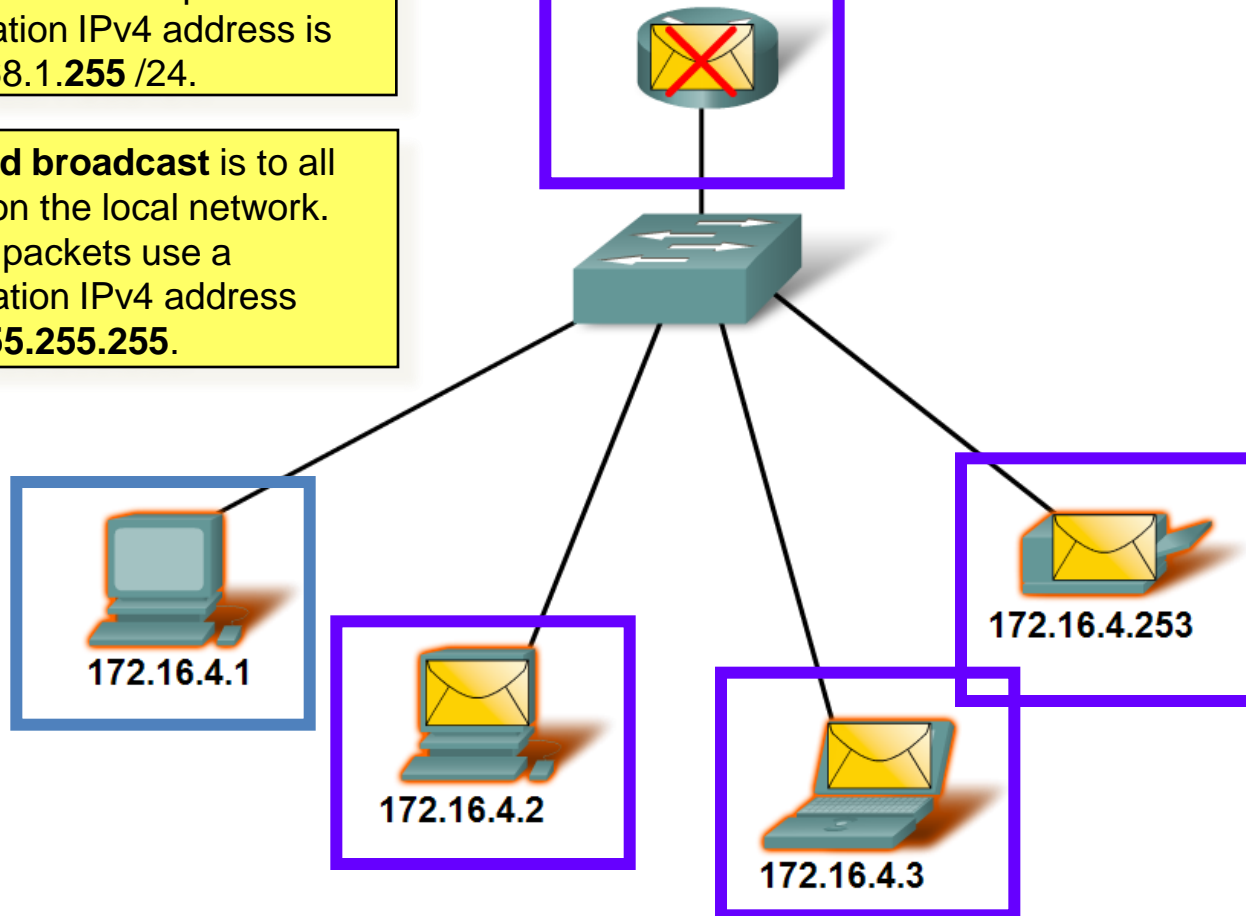

**Directed broadcast** is sent to all hosts on a specific network. An example destination IPv4 address is 192.168.1.**255** /24.

**Limited broadcast** is to all hosts on the local network. These packets use a destination IPv4 address **255.255.255.255**.

## Limited Broadcast

Source: 172.16.4.1

Destination: 255.255.255.255

# Types of IPv4 Addresses

Private vs.  
Public  
Addresses

# Private vs. Public Addresses

Private addresses cannot be routed over the Internet

# Special Use IPv4 Addresses

- Loopback address:

**127.0.0.1**

**127.0.0.0 – 127.255.255.255**

Hosts use to direct traffic to themselves.

- Link-Local addresses:

**169.254.0.0/16**

**169.254.0.0 –**

**169.254.255.255**

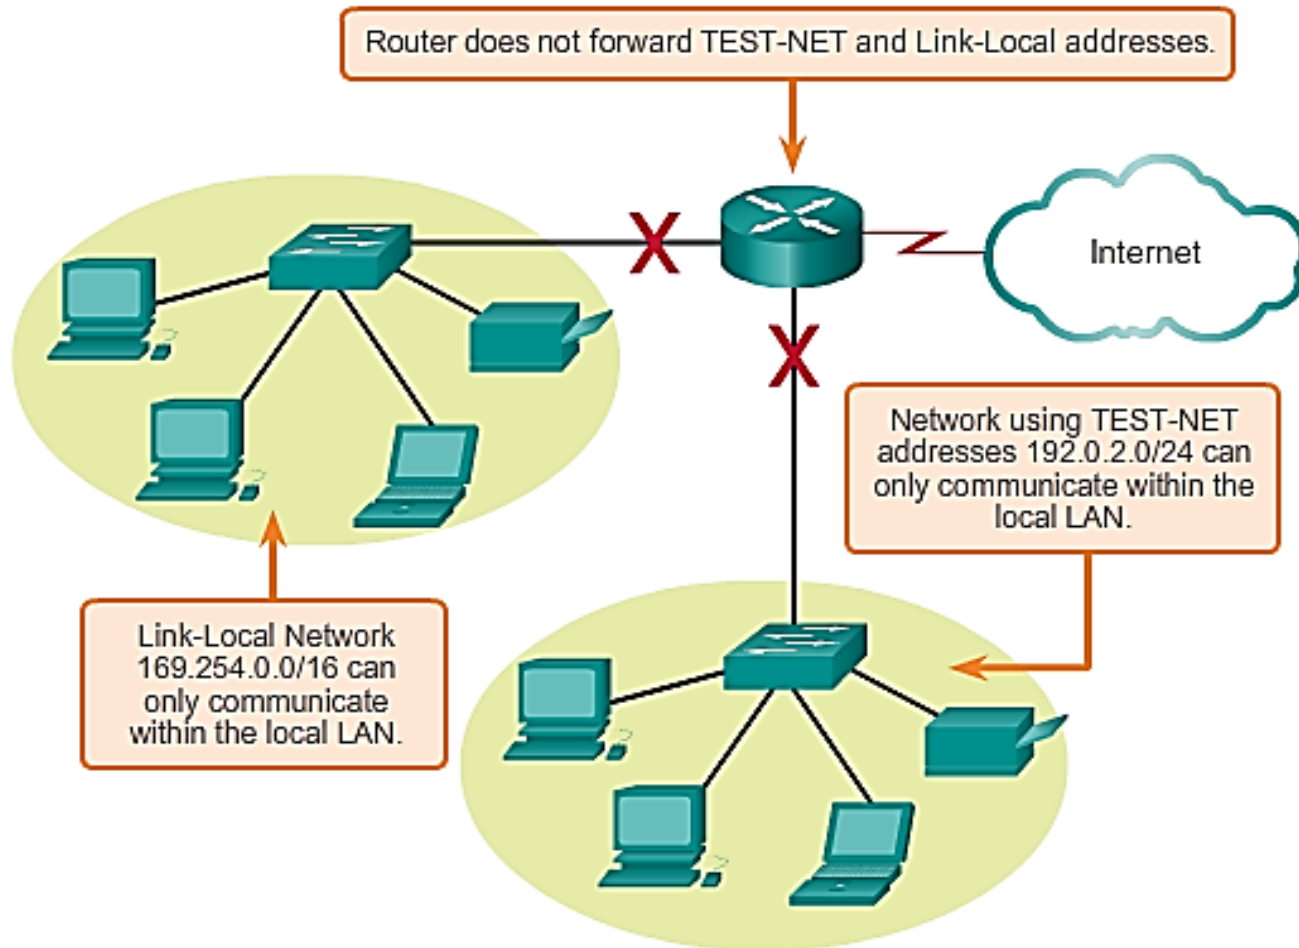

Host can automatically assign itself an address if it has none.

- TEST-NET addresses:

**192.0.2.0 to 192.0.2.255**

**(192.0.2.0 /24)**

# Special Use IPv4 Addresses

# Legacy Classful Addresses

Class A /8

Class B /16

Class C /24

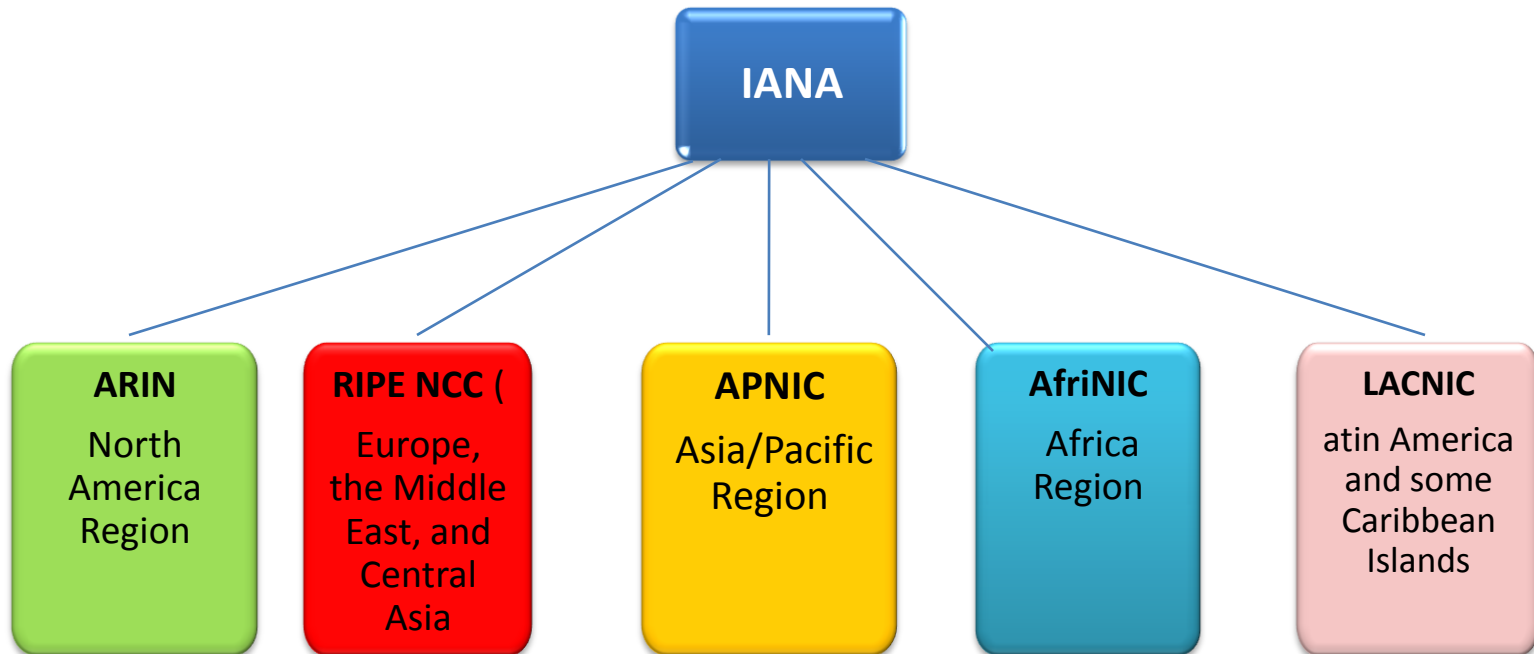

- **Class A, B, and C addresses:** 0.0.0.0 - 223.255.255.255
- **Multicast addresses:** 224.0.0.0 - 239.255.255.255
- **Experimental addresses:** 240.0.0.0 - 255.255.255.254

# Assignment of IP Addresses

- Internet Assigned Numbers Authority (IANA) manages the allocation of IPv4 and IPv6 addresses. IPv4 address space are allocated to various other registries to manage for particular purposes or for regional areas. These registration companies are called Regional Internet Registries (RIRs), as shown in the figure.

# Network Segmentation

Large Networks

# Large Networks

- In large networks, a flat network configuration creates major issues.
  - ❑ Excessive broadcast traffic (e.g., DHCP, ARP) in one domain.
  - ❑ Manageability and security
- As well, a network address with a /16 mask can support 65,534 host addresses on the same network.
  - ❑ What network would ever need to connect that many hosts on one network?

# Subnetting

- Large networks need to be segmented into smaller sub-networks called “**Subnets**”.
  - In the example, 5 subnets are created by subnetting the /16 network address into /24 addresses.

5 subnetworks capable of supporting 254 Hosts each.

# Reasons for Subnetting

Segmenting networks in subnets creates smaller groups of devices and services in order to:

- Create smaller broadcast domains.
- Limit the amount of traffic on the other network segments.
- Provide low-level security.

# Communication Between Subnets

- A router is required to subnet a network.
  - Each router interface is on a different subnet.
  - Devices on a subnet use the router interface as the default gateway.

Each router interface is in a different subnet and in its own broadcast domain.

# Network Segmentation

Reasons for  
Subnetting

# Subnetting an IPv4 Network

## Basic Subnetting

# Basic Subnetting

## 192.168.1.0/24 Network

<b>Address</b>	192	168	1	0000	0000
<b>Mask</b>	255	255	255	0000	0000
	Network Portion			Host Portion	

With no host bits borrowed, the host portion of both the network address and mask are all 0 bits.

# Basic Subnetting

Borrow 1 bit from the host portion of the address.

<b>Original</b>	192.	168.	1.	0	000	0000	1 Network
<b>Mask</b>	255.	255.	255.	0	000	0000	

The borrowed bit value is **0** for the Net 0 address.

<b>Net 0</b>	192.	168.	1.	0	000	0000
--------------	------	------	----	---	-----	------

The borrowed bit value is **1** for the Net 1 address.

<b>Net 1</b>	192.	168.	1.	1	000	0000
--------------	------	------	----	---	-----	------

2 Subnets

The new subnets have the **SAME** subnet mask.

<b>Mask</b>	255.	255.	255.	1	000	0000
-------------	------	------	------	---	-----	------

# Basic Subnetting

## Decimal Representation

<b>Original</b>	192.	168.	1.	0	000	0000	Network: 192.168.1.0/24
<b>Mask</b>	255.	255.	255.	0	000	0000	Mask: 255.255.255.0

Borrowing 1 bit creates 2 subnets with the same mask.

<b>Net 0</b>	192.	168.	1.	0	000	0000	Network: 192.168.1.0/25
<b>Mask</b>	255.	255.	255.	1	000	0000	Mask: 255.255.255.128
<b>Net 1</b>	192.	168.	1.	1	000	0000	Network: 192.168.1.128/25
<b>Mask</b>	255.	255.	255.	1	000	0000	Mask: 255.255.255.128

# Subnets in Use

## Address Range for 192.168.1.0/25 Subnet

Network Address

192. 168. 1. 0 000 0000 = 192.168.1.0

First Host Address

192. 168. 1. 0 000 0001 = 192.168.1.1

Last Host Address

192. 168. 1. 0 111 1110 = 192.168.1.126

Broadcast Address

192. 168. 1. 0 111 1111 = 192.168.1.127

# Subnets in Use

## Address Range for 192.168.1.128/25 Subnet

Network Address

192. 168. 1. **1** **000 0000** = 192.168.1.128

First Host Address

192. 168. 1. **1** **000 0001** = 192.168.1.129

Last Host Address

192. 168. 1. **1** **111 1110** = 192.168.1.254

Broadcast Address

192. 168. 1. **1** **111 1111** = 192.168.1.255

# Subnets in Use

```
R1 (config)#interface gigabitethernet 0/0
R1 (config-if)#ip address 192.168.1.1 255.255.255.128
R1 (config-if)#exit
R1 (config)#interface gigabitethernet 0/1
R1 (config-if)#ip address 192.168.1.129 255.255.255.128
```

# Subnetting Formulas

- Calculate Number of Subnets

Subnets =  $2^n$   
(where n = bits borrowed)

192. 168. 1. 0 000 0000

1 bit was borrowed

$2^1 = 2$  subnets

- Calculate Number of Hosts

Hosts =  $2^n$   
(where n = host bits remaining)

192. 168. 1. 0 000 0000

7 bits remain in host field

$2^7 = 128$  hosts per subnet  
 $2^7 - 2 = 126$  valid hosts per subnet

# Variable Length Subnet Masking (VLSM)

Traditional  
Subnetting

# Traditional Subnetting

- So far, every subnet was the same size and all accommodated the same number of hosts.  
If all the subnets have the same requirements for the number of hosts, these fixed size address blocks would be efficient.

- For example, how many subnets are required?  
7 subnets of varying size.

# Traditional Subnetting

- To meet the host requirement of the largest LAN we could borrow 3 bits (/27) to create 8 subnets of 30 hosts each.  
But it also wastes addresses on the point-to-point links and limits future growth by reducing the total number of subnets available.

- Solution:  
“Subnet a subnet” using Variable Length Subnet Mask (VLSM).

# Special Use IPv4 Addresses

- VLSM allows a network space to be divided in unequal parts.
- With VLSM the subnet mask will vary depending on how many bits have been borrowed for a particular subnet, thus the “variable” part of the VLSM.
- VLSM enables a network number to be configured with different subnet masks on different interfaces.
- Allows for more hierarchical levels within an addressing plan.
  - Allows for better route summarization.

# VLSM Example

The four LANs in our previous example can be accommodated using a /27 subnet mask.

# VLSM Example

- This would create subnets with increments of 32, therefore:

	11000000	.10101000	.00010100	.00000000	192.168.20.0/24		
0	11000000	.10101000	.00010100	.000	00000	192.168.20.0/27	LANs A, B, C, D
1	11000000	.10101000	.00010100	.001	00000	192.168.20.32/27	
2	11000000	.10101000	.00010100	.010	00000	192.168.20.64/27	
3	11000000	.10101000	.00010100	.011	00000	192.168.20.96/27	
4	11000000	.10101000	.00010100	.100	00000	192.168.20.128/27	Unused / Available
5	11000000	.10101000	.00010100	.101	00000	192.168.20.160/27	
6	11000000	.10101000	.00010100	.110	00000	192.168.20.192/27	
7	11000000	.10101000	.00010100	.111	00000	192.168.20.224/27	

Basic subnets

# VLSM Example

- The WAN interfaces of the routers are assigned the IP addresses and mask for the /30 subnets (2 hosts).

- In this example, the last subnet is subnetted into /30 subnets to accommodate WAN interfaces:

# VLSM Example

Network Topology: VLSM Subnets

```
R1 (config) #interface gigabitethernet 0/0
R1 (config-if) #ip address 192.168.20.1 255.255.255.224
R1 (config-if) #exit
R1 (config) #interface serial 0/0/0
R1 (config-if) #ip address 192.168.20.225 255.255.255.252
R1 (config-if) #end
R1 #
```

# VLSM Example

Network Topology: VLSM Subnets

```
R2 (config) #interface gigabitethernet 0/0
R2 (config-if) #ip address 192.168.20.33 255.255.255.224
R2 (config-if) #exit
R2 (config) #interface serial 0/0/0
R2 (config-if) #ip address 192.168.20.226 255.255.255.252
R2 (config-if) #exit
R2 (config) #interface serial 0/0/1
R2 (config-if) #ip address 192.168.20.229 255.255.255.252
R2 (config-if) #end
R2 #
```

# VLSM Example

Network Topology: VLSM Subnets

```
R3(config)#interface gigabitethernet 0/0
R3(config-if)#ip address 192.168.20.65 255.255.255.224
R3(config-if)#exit
R3(config)#interface serial 0/0/0
R3(config-if)#ip address 192.168.20.230 255.255.255.252
R3(config-if)#exit

# Anatomy of a Router

Why Routing

# Why Routing

## Routers Route Packets

The router is responsible for the routing of traffic between networks

# Functions of a Router

- Routers are computers
- Routers interconnects networks
- Routers choose best paths

# Router Components

- Routers are essentially computers and require:
  - ❑ Operating systems (OS)
  - ❑ Central processing units (CPU)
  - ❑ Random-access memory (RAM)
  - ❑ Read-only memory (ROM)
- Routers also have special memory that includes
  - ❑ Flash
  - ❑ Nonvolatile random-access memory (NVRAM).

# Router Memory

Memory	Volatile / Non-Volatile	Stores

# Router Backplane

# Connecting to a Router

# Router Interfaces

- A router interface is a physical connector that enables a router to send or receive packets
- Types of router interfaces:
  - Ethernet
  - FastEthernet
  - Gigabit Ethernet
  - Serial
  - DSL
  - Cable
  - ISDN

# LAN and WAN Interfaces

- Router interfaces can be grouped into two categories:
  - Ethernet LAN interfaces: Requires an IP address and enabled.
  - Serial WAN interfaces – Requires an IP address and enabled.

# Router Switching Function

# PC1 Sends a Packet to PC2

Because PC2 is on different network, I will encapsulate the packet and send it to the router on MY network. Let me find that MAC address....

## Layer 2 Data Link Frame

## Packet's Layer 3 data

Dest. MAC 00-10	Source MAC 0A-10	Type 0x800	Source IP 192.168.1.1 0	Dest. IP 192.168.4.1 0	IP fields	Data	Trailer
--------------------	---------------------	------------	-------------------------------	------------------------------	-----------	------	---------

## PC1's ARP Cache for R1

IP Address	MAC Address
192.168.1.1	00-10

# R1 Forwards the Packet to PC2

A frame was sent to me by MAC address 0A-10. Let me investigate further.

Layer 2 Data Link Frame

Packet's Layer 3 data

Dest. MAC 00-10	Source MAC 0A-10	Type 0x800	Source IP 192.168.1.1 0	Dest. IP 192.168.4.1 0	IP fields	Data	Trailer
--------------------	---------------------	------------	-------------------------------	------------------------------	-----------	------	---------

I can see from the type and destination IP address that this packet needs to be forwarded.

Layer 2 Data Link Frame

Packet's Layer 3 data

		Type 0x800	Source IP 192.168.1.1 0	Dest. IP 192.168.4.1 0	IP fields	Data	Trailer
--	--	------------	-------------------------------	------------------------------	-----------	------	---------

# R1 Forwards the Packet to PC2

I have a route out my Fa0/1 interface to reach PC2.

Layer 2 Data Link Frame

Packet's Layer 3 data

		Type 0x800	Source IP 192.168.1.1 0	Dest. IP 192.168.4.1 0	IP fields	Data	Trailer
--	--	------------	-------------------------------	------------------------------	-----------	------	---------

R1's Routing Table

Network	Hops	Next-hop-IP	Exit Interface
192.168.1.0/24	0	Dir. Connect.	Fa0/0
192.168.2.0/24	0	Dir. Connect.	Fa0/1
192.168.3.0/24	1	192.168.2.2	Fa0/1
<b>192.168.4.0/24</b>	<b>2</b>	<b>192.168.2.2</b>	<b>Fa0/1</b>

# R1 Forwards the Packet to PC2

Let me rebuild the information in the frame.

Layer 2 Data Link Frame

Packet's Layer 3 data

		Type 0x800	Source IP 192.168.1.1 0	Dest. IP 192.168.4.1 0	IP fields	Data	Trailer
--	--	------------	-------------------------------	------------------------------	-----------	------	---------

R1's Routing Table

Network	Hops	Next-hop-IP	Exit Interface
192.168.1.0/24	0	Dir. Connect.	Fa0/0
192.168.2.0/24	0	Dir. Connect.	Fa0/1
192.168.3.0/24	1	192.168.2.2	Fa0/1
<b>192.168.4.0/24</b>	<b>2</b>	<b>192.168.2.2</b>	<b>Fa0/1</b>

# R1 Forwards the Packet to PC2

My ARP table tells me that PC2 uses MAC address 0B-31

Layer 2 Data Link Frame

Packet's Layer 3 data

Dest. MAC 0B-31		Type 0x800	Source IP 192.168.1.1 0	Dest. IP 192.168.4.1 0	IP fields	Data	Trailer
--------------------	--	------------	-------------------------------	------------------------------	-----------	------	---------

R1's ARP Cache

IP Address	MAC Address
192.168.2.2	0B-31

R1's Routing Table

Network	Hops	Next-hop-IP	Exit Interface
192.168.1.0/24	0	Dir. Connect.	Fa0/0
192.168.2.0/24	0	Dir. Connect.	Fa0/1
192.168.3.0/24	1	192.168.2.2	Fa0/1
192.168.4.0/24	2	192.168.2.2	Fa0/1

# R1 Forwards the Packet to PC2

The frame is now ready for me to send out my Fa0/1.

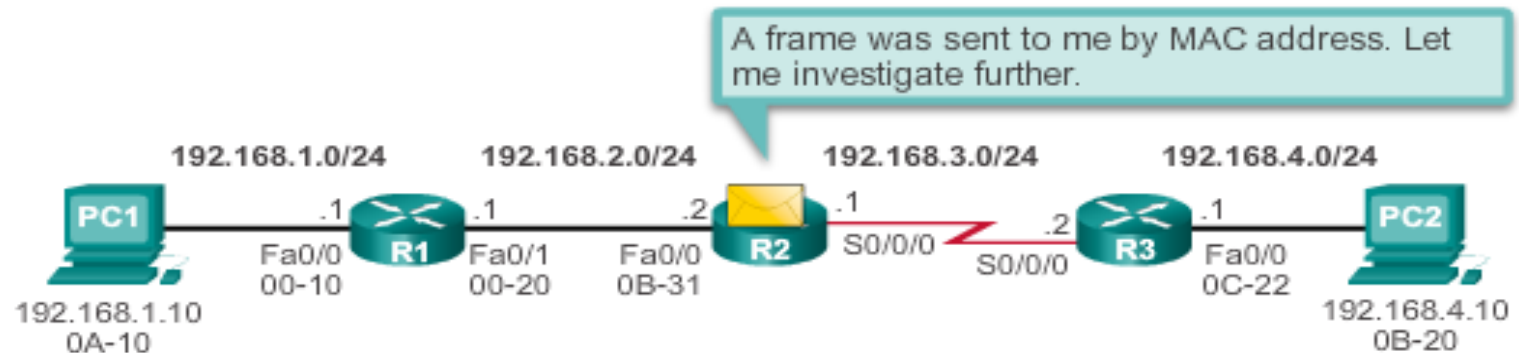

## Layer 2 Data Link Frame

## Packet's Layer 3 data

Dest. MAC 0B-31	Source MAC 00-20	Type 0x800	Source IP 192.168.1.1 0	Dest. IP 192.168.4.1 0	IP fields	Data	Trailer

192.168.4.0/24	0	Dir. Connect.	Fa0/0

# Reach the Destination – R3 Forwards the Packet to PC2

Oh look, a frame is being sent to my MAC address, let me process it. The packet also matches my IP address, so it MUST be mine.

## Layer 2 Data Link Frame

## Packet's Layer 3 data

Dest. MAC 0B-20	Source MAC 0C-22	Type 0x800	Source IP 192.168.1.1 0	Dest. IP 192.168.4.10	IP fields	Data	Trailer
--------------------	---------------------	------------	-------------------------------	--------------------------	-----------	------	---------

# Switching Packets Between Networks

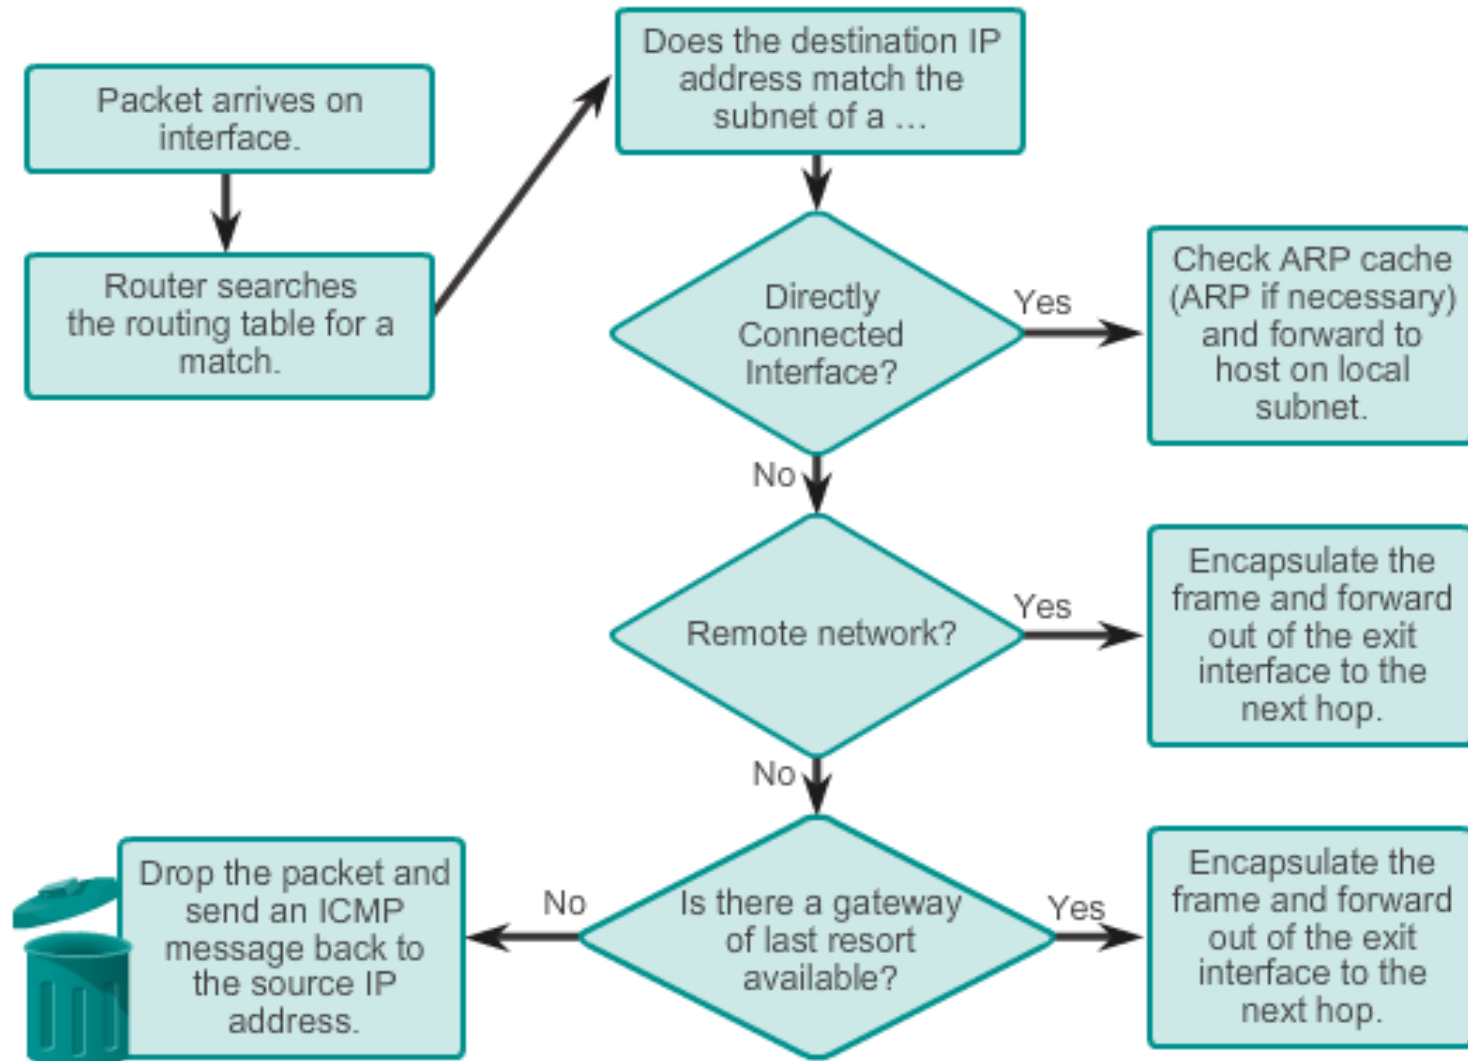

## Router Switching Functions

# Path Determination

Routing Decisions

The background features a light blue grid pattern. Overlaid on this grid are several vibrant, multi-colored wavy lines that sweep across the lower right portion of the slide, creating a sense of motion and complexity.

# Routing Decisions

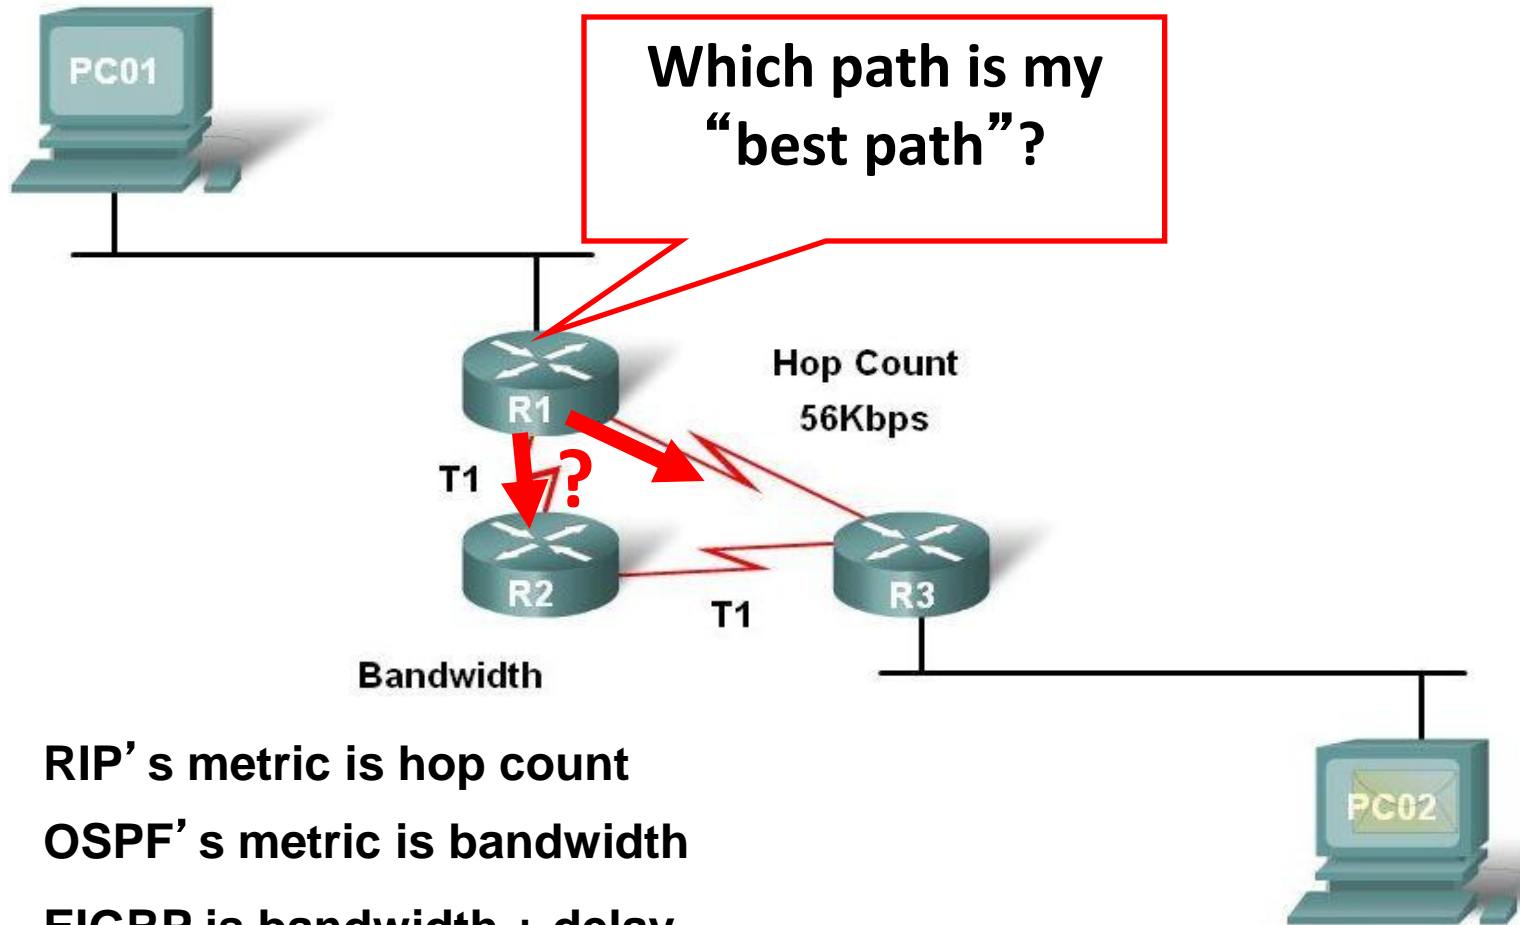

# Best Path

- Router's determine best-path to a network:
  - Depends on the **routing protocol**
  - A protocol used between routers to determine "**best path**"
- Have own *rules* and *metrics*.  
**A metric:**  
Quantitative value used to measure the distance to a given route.
- **Best path:**  
Path with the **lowest metric**.

# Routing Metric

## Hop Count vs Bandwidth as a Metric

RIP's metric is hop count

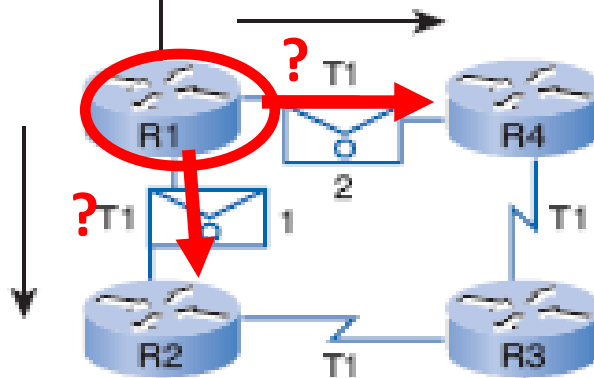

OSPF's metric is bandwidth

EIGRP is bandwidth + delay

# Load Balancing

To reach the 192.168.1.0/24 network it is 2 hops via R2 and 2 hops via R4.

192.168.1.0/24

What happens if a routing table has two or more paths with the same metric to the same destination network? (**equal-cost metric**)

Router will perform **equal-cost load balancing**.

All routing protocols (RIP, EIGRP, OSPF) support equal cost load balancing; EIGRP also supports unequal cost load balancing.

# Path Determination

Routing Decisions  
Best Path  
Load Balancing

# Analyze the Routing Table

The Routing Table

# The Routing Table

A routing table is a file stored in RAM that contains information about:

- Directly connected routes
- Remote routes
- Network or next hop associations

# The Routing Table

# Routing Table Sources

The **show ip route** commands are used to display the contents of the routing table:

**Local route interfaces** - Added to the routing table when an interface is configured. (displayed in IOS 15 or newer)

**Directly connected interfaces** - Added to the routing table when an interface is configured and active.

**Static routes** - Added when a route is manually configured and the exit interface is active.

**Dynamic routing protocol** - Added when EIGRP or OSPF are implemented and networks are identified.

# Routing Table for R1

```
R1# show ip route
```

```
Codes: L - local, C - connected, S - static, R - RIP, M - mobile, B - BGP
```

```
D - EIGRP, EX - EIGRP external, O - OSPF, IA - OSPF inter area
```

```
N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
```

```
E1 - OSPF external type 1, E2 - OSPF external type 2, E - EGP
```

```
i - IS-IS, L1 - IS-IS level-1, L2 - IS-IS level-2, ia -
```

```
IS-IS inter area
```

```
* - candidate default, U - per-user static route, o - ODR
```

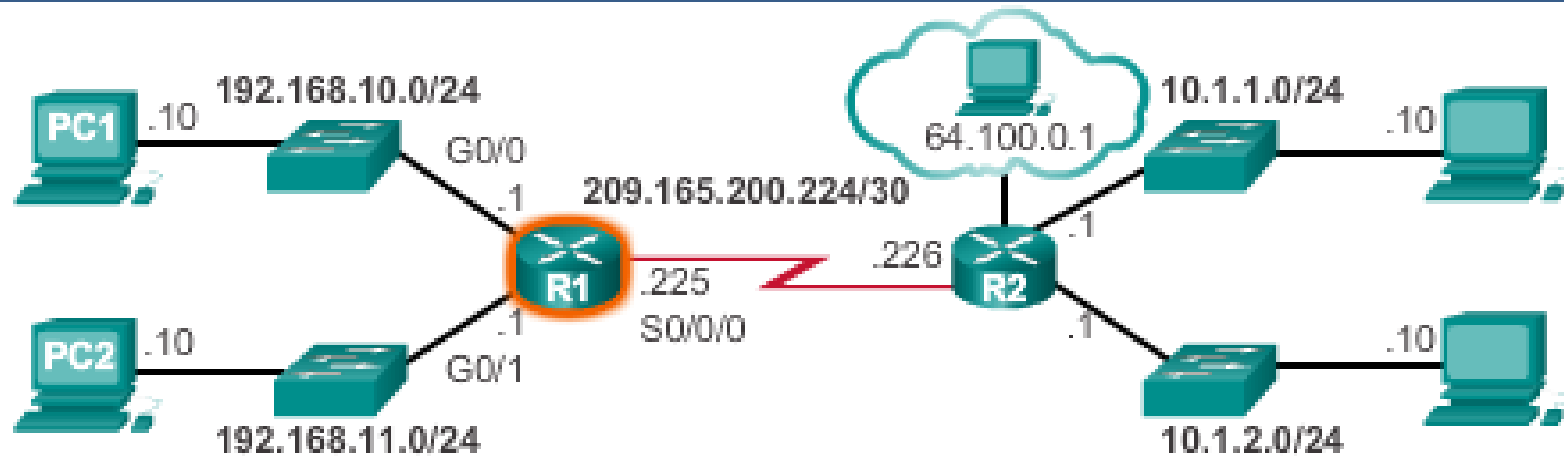

```
P - periodic downloaded static route
```

```
Gateway of last resort is not set
```

```
10.0.0.0/8 is variably subnetted, 2 subnets, 2 masks
```

```
D 10.1.1.0/24 [90/2170112] via 209.165.200.226, 00:00:05,
```

# Remote Network Routing Entries

```
D 10.1.1.0/24 [90/2170112] via 209.165.200.226, 00:00:05, Serial0/0/0
```

## Legend

-  - Identifies how the network was learned by the router.
-  - Identifies the destination network.
-  - Identifies the administrative distance (trustworthiness) of the route source.
-  - Identifies the metric to reach the remote network.
-  - Identifies the next-hop IP address to reach the remote network.
-  - Identifies the amount of elapsed time since the network was discovered.
-  - Identifies the outgoing interface on the router to reach the destination network.

```

# Dynamic Routing

# Dynamic Routing Protocols

- Dynamic routing is used by routers to share information about the reachability and status of remote networks.
- It performs network discovery and maintains routing tables.
- Cisco routers can support a variety of dynamic IPv4 routing protocols including:
  - **EIGRP** – Enhanced Interior Gateway Routing Protocol
  - **OSPF** – Open Shortest Path First
  - **IS-IS** – Intermediate System-to-Intermediate System
  - **RIP** – Routing Information Protocol

# Testing the Network: Ping and ICMPv4

Testing the  
Network

# Testing the Network

- IP is a best effort delivery system.
  - ❑ No mechanism to ensure that the data is delivered
- So how do we know if a packet encountered a problem along the way?
- **Internet Control Message Protocol (ICMP)**

# Internet Control Message Protocol (ICMP)

- ICMP is available for both IPv4 and IPv6.
- ICMP is used for:
  - Informational messages (ping, traceroute)
  - Error messages (network unreachable)
- ICMP is a layer 3 protocol directly encapsulated in another layer 3 protocol IP.
  - No transport header
- Knowledge of ICMP control messages is an essential part of network troubleshooting
- The ICMP packets are identified by **type** and **code** fields.

# Host Confirmation - Ping

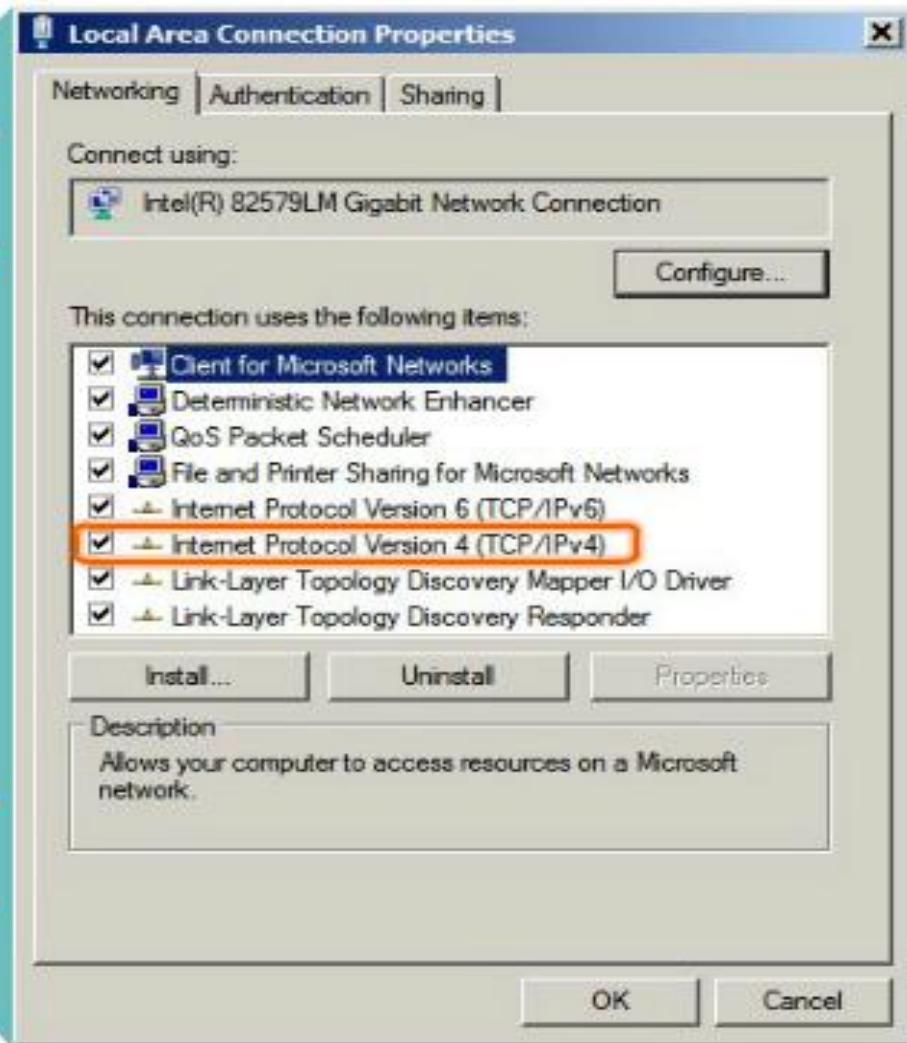

- Ping is a utility used to verify connectivity to an IP host.
  - It measures the round-trip time for messages sent from the originating host to a destination computer.
- Ping uses an ICMP Echo Message to determine if a host is reachable.
  - A host initiates a ping (ICMP Echo Request) and the destination replies (ICMP Echo Reply).
  - ICMP only reports on the status of the delivered packet to the source device.

# Ping – Testing the Local Stack

Pinging the local host confirms that TCP/IP is installed and working on the local host.

Pinging **127.0.0.1** causes a device to ping itself.

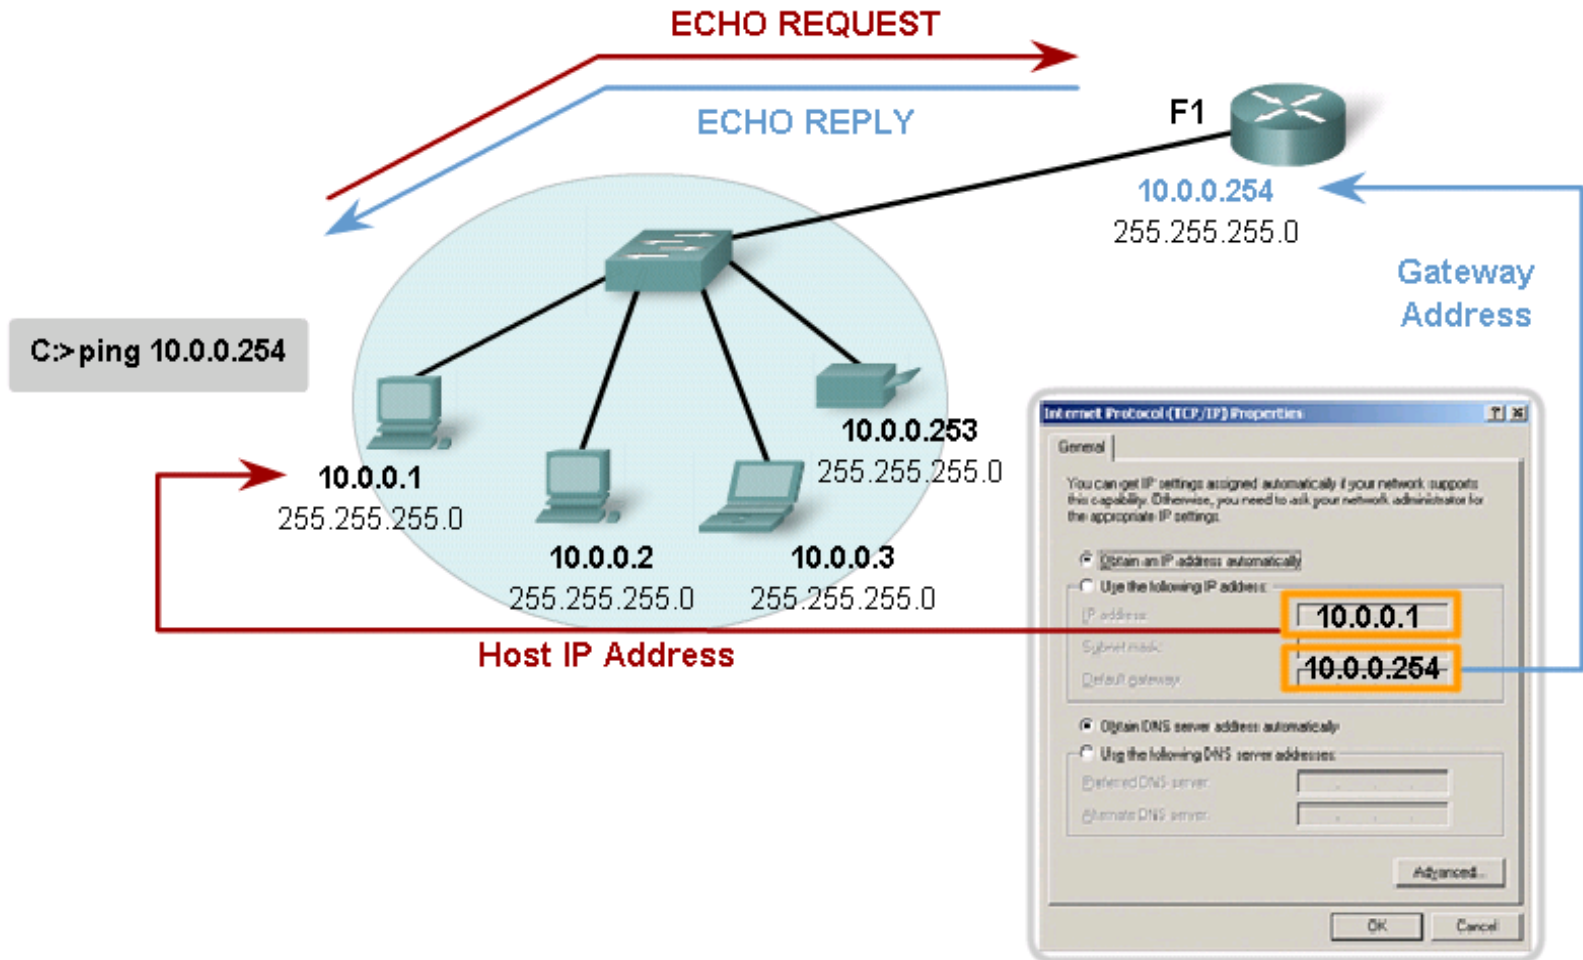

# Ping – Testing Connectivity to the Local LAN

Testing Connectivity to Local Network

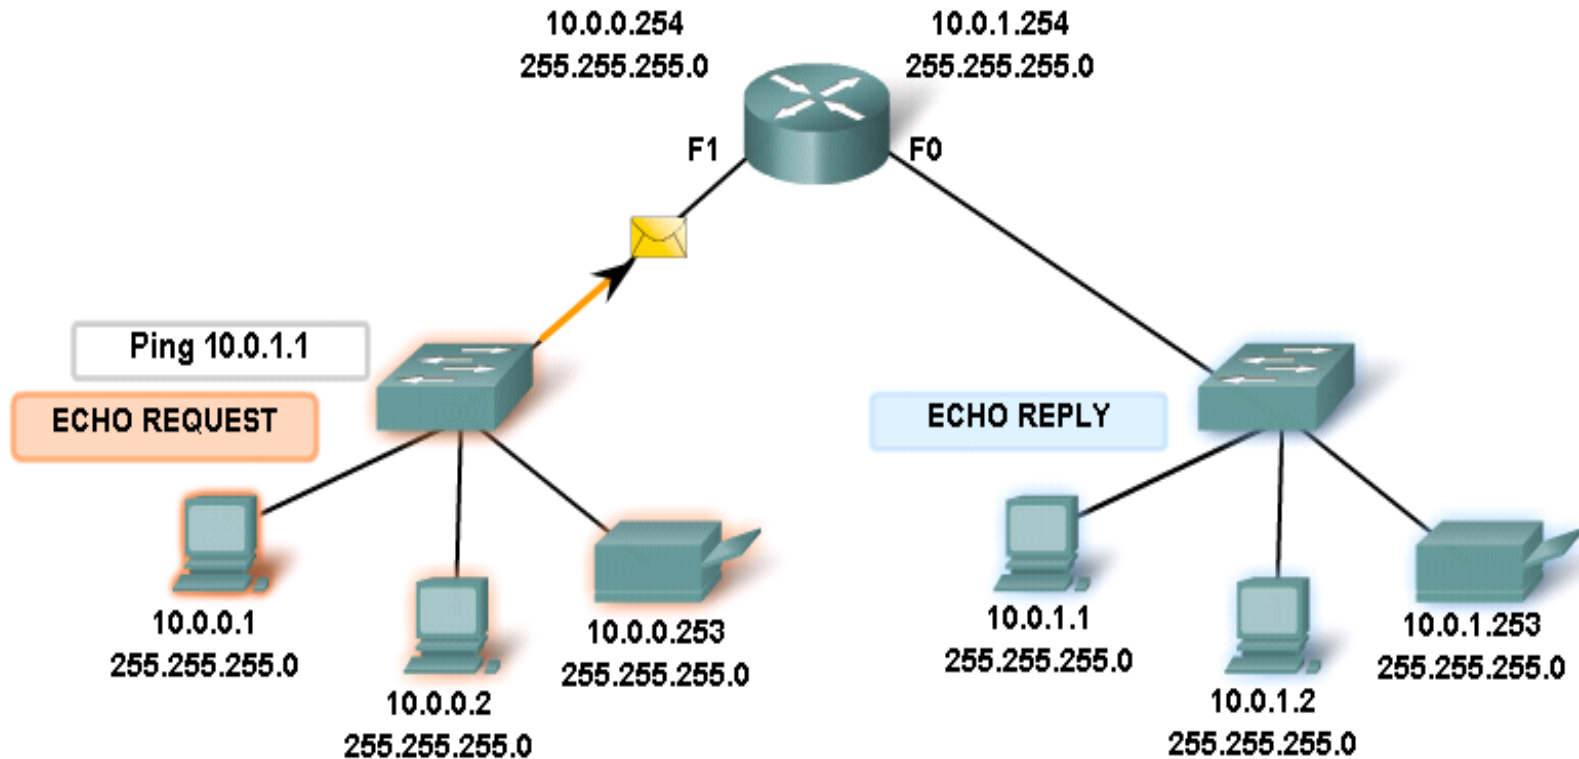

Ping Local Gateway

# Ping – Testing Connectivity to Remote Host

Testing Connectivity to Remote LAN  
Ping to a remote host

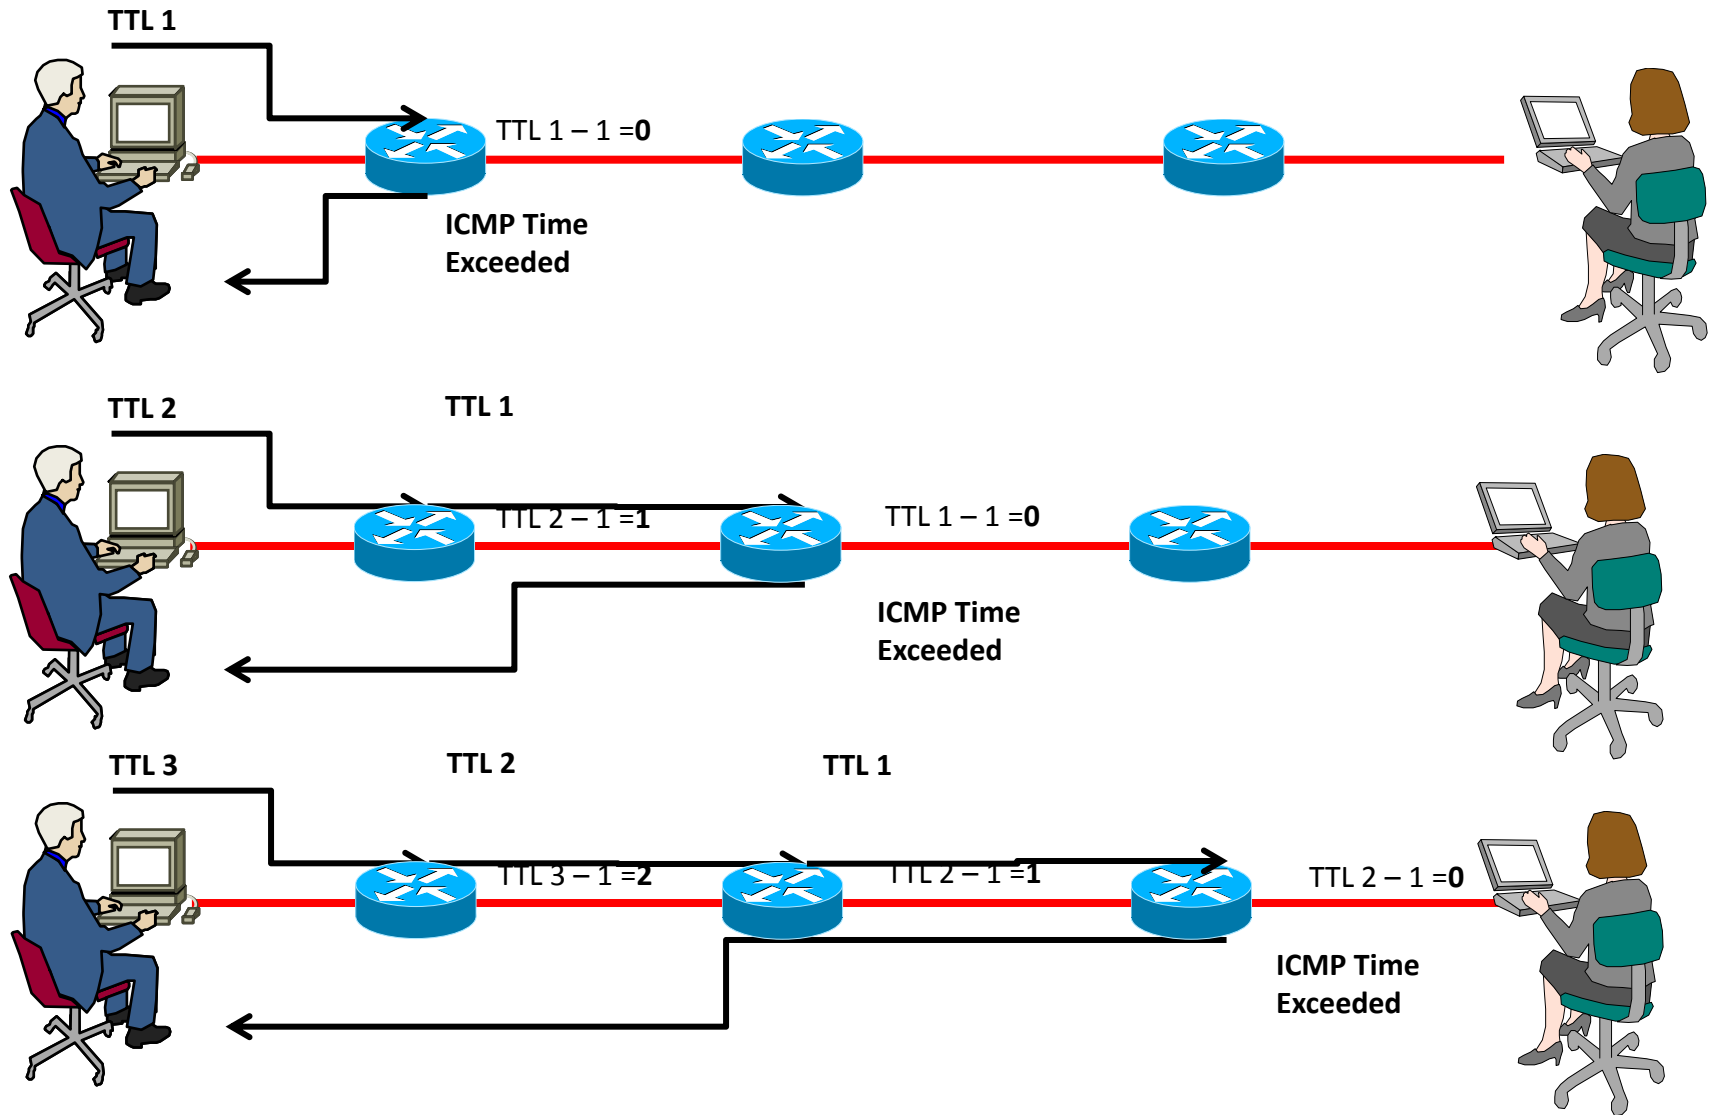

10.0.1.0	F0
10.0.0.0	F1

# Traceroute – Testing the Path

- **Ping** is used to indicate the connectivity between two hosts.
- **Traceroute (tracert)** is used to observe the path between these hosts.
  - The trace lists hops successfully reached along the way providing us with important verification and troubleshooting information.
  - If the data fails at some hop along the way, we have the address of the last router that responded to the trace indicating where the problem is.
