## Lecture No-3 Elements of three dimensional geometry

## Distance formula in three dimension

Let $P\left(x_{1}, y_{1}, z_{1}\right)$ and $Q\left(x_{2}, y_{2}, z_{2}\right)$ be two points such that $P Q$ is not parallel to one of the coordinate axis Then $P Q=\sqrt{\left(x_{2}-x_{1}\right)^{2}+\left(y_{2}-y_{1}\right)^{2}+\left(z_{2}-z_{1}\right)^{2}}$ Which is known as Distance fromula between the points P and Q .

## Example of distance formula

$$
\begin{aligned}
& \text { Let us considerthe points } A(3,2,4), B(6,10,-1) \text {, } \\
& \text { and } C(9,4,1) \\
& \text { Then } \\
& |A B|=\sqrt{(6-3)^{2}+(10-2)^{2}+(-1-4)^{2}}=\sqrt{98}=7 \sqrt{2} \\
& |A C|=\sqrt{(9-3)^{2}+(4-2)^{2}+(1-4)^{2}}=\sqrt{49}=7 \\
& |B C|=\sqrt{(9-6)^{2}+(4-10)^{2}+(1+1)^{2}}=\sqrt{49}=7
\end{aligned}
$$

## Mid point of two points

If R is the middle point of the line segment PQ , then the co-ordinates of the middle points are
$\mathrm{x}=(\mathrm{x} 1+\mathrm{x} 2) / 2$,
$y=(y 1+y 2) / 2$,
$\mathrm{z}=(\mathrm{z} 1+\mathrm{z} 2) / 2$
Let us consider tow points $\mathrm{A}(3,2,4)$ and $\mathrm{B}(6,10,-1)$
Then the co-ordinates of mid point of $A B$ is
$[(3+6) / 2,(2+10) / 2,(4-1) / 2]$
$=(9 / 2,6,3 / 2)$

## Direction Angles

Thedirection angles $\alpha \beta, \gamma$ of a lineare defined as
$\alpha=\quad$ Angle between lineand the positive $x$-axis
$\beta=\quad$ Angle between line and the positive $y$-axis
$\gamma=\quad$ Angle between lineand the positive zaxis.
By definition, each of these angles lies between 0 and $\pi$

## Direction Ratios

Cosines of direction angles are called direction cosines
Any multiple of direction cosines are called direction numbers or direction ratios of the line $L$.

## Given a point, finding its Direction cosines

y-axis

## Direction angles of a Line

> From triangle we
> can write
> $\cos \alpha=\mathbf{x} / \mathbf{r}$
> $\cos \beta=\mathbf{y} / \mathbf{r}$

The angles which a line makes with positive $\mathrm{x}, \mathrm{y}$ and z -axis are known as Direction Angles. In the above figure the blue line has direction angles as $\alpha$, $\square \square \square$ and $\square \square \square$ which are the angles which blue line makes with $\mathrm{x}, \mathrm{y}$ and z -axis respectively.

## Direction cosines:

Now if we take the cosine of the Direction Angles of a line then we get the Direction cosines of that line. So the Direction Cosines of the above line are given by

$$
\begin{gathered}
\cos \alpha=\frac{x}{O P}=\frac{x}{\sqrt{x^{2}+y^{2}+z^{2}}} \\
\cos \beta=\frac{y}{O P}=\frac{y}{\sqrt{x^{2}+y^{2}+z^{2}}} \\
\text { Similarly, } \\
\cos \gamma=\frac{z}{O P}=\frac{z}{\sqrt{x^{2}+y^{2}+z^{2}}} \\
\cos ^{2} \alpha+\cos ^{2} \beta+\cos ^{2} \gamma=1
\end{gathered}
$$

## Direction cosines and direction ratios of a line joining two points

-For a line joining two points $\mathrm{P}\left(\mathrm{x}_{1}, \mathrm{y}_{1}, \mathrm{z}_{1}\right)$ and $\mathrm{Q}\left(\mathrm{x}_{2}, \mathrm{y}_{2}, \mathrm{x}_{2}\right)$ the direction ratios are

$$
\mathrm{x}_{2}-\mathrm{x}_{1}, \mathrm{y}_{2}-\mathrm{y}_{1}, \mathrm{z}_{2}-\mathrm{z}_{1} \text { and the directions cosines are } \frac{\mathrm{x}_{2}-\mathrm{x}_{1}}{|P Q|}, \frac{\mathrm{y}_{2}-\mathrm{y}_{1}}{|P Q|} \text { and } \frac{\mathrm{z}_{2}-\mathrm{z}_{1}}{|P Q|} .
$$

Example For a line joining two points $\mathrm{P}(1,3,2)$ and $\mathrm{Q}(7,-2,3)$ the direction ratios are

$$
\begin{gathered}
7-1,-2-3,3-2 \\
6,-5, \quad 1
\end{gathered}
$$

and the directions cosines are
$6 / \sqrt{ } 62, \quad-5 / \sqrt{ } 62, \quad 1 / \sqrt{ } 62$
In two dimensional space the graph of an equation relating the variables x and y is the set of all point ( $\mathrm{x}, \mathrm{y}$ ) whose co-ordinates satisfy the equation. Usually, such graphs are curves. In three dimensional space the graph of an equation relating the variables $\mathrm{x}, \mathrm{y}$
and z is the set of all point $(\mathrm{x}, \mathrm{y}, \mathrm{z})$ whose co-ordinates satisfy the equation.
Usually, such graphs are surfaces.

## Intersection of two surfaces

-Intersection of two surfaces is a curve in three dimensional space.
-It is the reason that a curve in three dimensional space is represented by two equations representing the intersecting surfaces.

## Intersection of Cone and Sphere

## Intersection of Two Planes

If the two planes are not parallel, then they intersect and their intersection is a straight line. Thus, two non-parallel planes represent a straight line given by two simultaneous linear equations in $\mathrm{x}, \mathrm{y}$ and z and are known as non-symmetric form of equations of a straight line.

| REGION | DESCRIPTION | EQUATION |
| :---: | :---: | :---: |
| $x y$-plane | Consists of all points of the form $(x, y, 0)$ | $z=0$ |
| $x z$-plane | Consists of all points of the form $(x, 0, z)$ | $y=0$ |
| $y z$-plane | Consists of all points of the form $(0, y, z)$ | $x=0$ |
| $x$-axis | Consists of all points of the form $(x, 0,0)$ | $y=0, z=0$ |
| $y$-axis | Consists of all points of the form $(0, y, 0)$ | $z=0, x=0$ |
| $z$-axis | Consists of all points of the form $(0,0, z)$ | $x=0, y=0$ |

## Planes parallel to Co-ordinate Planes

## General Equation of Plane

Any equation of the form

$$
a x+b y+c z+d=0
$$

where $\mathrm{a}, \mathrm{b}, \mathrm{c}, \mathrm{d}$ are real numbers,represent a plane.

## Sphere

The standard equation of the sphere of radius a centered at $\left(x_{0}, y_{0}, z_{0}\right)$ is
$\left(x-x_{0}\right)^{2}+\left(y-y_{0}\right)^{2}+\left(z-z_{0}\right)^{2}=a^{2}$

The level surfaces of $f(x, y, z)=$ $\sqrt{x^{2}+y^{2}+z^{2}}$ are concentric spheres.
